J-Link / J-Trace User Guide

Software Version V5.12d Manual Rev. 1

Date: April 27, 2016

Document: UM08001

A product of SEGGER Microcontroller GmbH & Co. KG

Revisions

This manual describes the J-Link and J-Trace device.

For further information on topics or routines not yet specified, please contact us.

Revision	Date	Ву	Explanation
V5.12d Rev. 1	160427	AG	Chapter "Working with J-Link and J-Trace" * Section "J-Link script files" updated.
V5.12d Rev. 0	160425	AG	Chapter "Working with J-Link and J-Trace" * Section "J-Link script files" updated.
V5.12c Rev. 1	160418	NG	Chapter "Related Software" * Section "J-Link Commander" Typo fixed.
V5.12c Rev. 0	160413	NG	Chapter "Related Software" * Section "J-Link Commander" Commands and commandline options added. Chapter "Working with J-Link and J-Trace" * Section "Command strings" Command "SetRTTTeInetPort" added. Chapter "Flash Download" * Section "Debugging applications that change flash contents at runtime" added.

Revision	Date	Ву	Explanation
V5.10u Rev. 0	160317	AG	Chapter "Monitor Mode Debugging" * Section "Target application performs reset" added.
V5.10t Rev. 0	160314	AG	Chapter "Monitor Mode Debugging" * Section "Enable Monitor Debugging" updated. * Section "Forwarding of Monitor Interrupts" added.
V5.10 Rev. 3	160309	EL	Chapter "J-Flash SPI" updated.
V5.10 Rev. 2	160215	AG	Chapter "RTT" updated.
V5.10 Rev. 1	151204	AG	Chapter "RDI" updated. Chapter "Semihosting" added.
V5.10 Rev. 0	151127	NG	Chapter "Related Software" * Section "J-Scope" removed.
V5.02m Rev. 0	151125	AG	Chapter "Working with J-Link and J-Trace" * Section "The J-Link settings file" added. Chapter "Low Power Debugging" added.
V5.02l Rev. 0	151123	AG	Various Chapters * Some typos corrected.
V5.02i Rev. 1	151106	RH	Chapter "J-Flash SPI" * Section "Send custom commands" added.
V5.02i Rev. 0	151105	RH	Chapter "Related Software" * Section "J-Link Commander" exec command added. Chapter "Working with J-Link and J-Trace" * Section "Command strings" New commands added.
V5.02f Rev. 1	151022	NG	Chapter "Related Software" * Section "J-Scope" updated.
V5.02f Rev. 1	151022	EL	Chapter "Target interfaces and adapters" * Section "Reference volatge (VTref)" added.
V5.02f Rev. 0	151007	RH	Chapter "Working with J-Link and J-Trace" * Section "J-Link script files" updated.
V5.02e Rev. 0	151001	AG	Chapter "Working with J-Link and J-Trace" * Section "J-Link script files" updated.
V5.02c Rev. 1	150925	NG	Chapter "Licensing" * Sectin "Original SEGGER products" updated. Chapter "Flash download" * Section "Setup for various debuggers (CFI flash)" updated.
V5.02c Rev. 0	150916	RH	Chapter "Flash download" * Section "Setup for various debuggers (SPIFI flash)" added.
V5.02c Rev. 0	150914	RH	Chapter "Introduction" * Section "J-Link / J-Trace models" updated. * Section "Supported OS" Added Windows 10
V5.02a Rev. 0	150903	AG	Chapter "Monitor Mode Debugging" added.
V5.02 Rev. 0	150820	AG	Chapter "Working with J-Link and J-Trace" * Section "Command strings" "DisableCortexMXPSRAutoCorrectTBit" added.
V5.02 Rev. 0	150813	AG	Chapter "Monitor Mode Debugging" added.
V5.00 Rev. 1	150728	NG	Chapter "Related Software" * Section "J-Link Commander" Sub-Section "Command line options" updated.

Revision	Date	By	Explanation
V5.00 Rev. 0	150609	AG	Chapter "Flash download" * Section "QSPI flash support" added. Chapter "Flash breakpoints" * Section "Flash Breakpoints in QSPI flash" added
V5.00 Rev. 0	150520	EL	Chapter "J-Flash SPI" * Initial version added
V4.99b Rev. 0	150520	EL	Chapter "Related Software" * Section "J-Link STM32 Unlock" - Added command line options
V4.99a Rev. 0	150429	AG	Chapter "Target interfaces and Adapters" Chapter "20-pin J-Link connector", section "Pinout for SPI" added.
V4.98d Rev. 0	150427	EL	Chapter "Related Software" * Section "Configure SWO output after device reset" updated.
V4.98b Rev. 0	150410	AG	Chapter "Licensing" * Section "J-Trace for Cortex-M" updated.
V4.98 Rev. 0	150320	NG	Chapter "Related Software" * Section "J-Link Commander" Sub-Section "Commands" added. Chapter "Working with J-Link and J-Trace" * Section "J-Link script files" updated
V4.96f Rev. 0	150204	JL	Chapter "Related Software" * Section "GDB Server" Exit code description added.
V4.96 Rev. 0	141219	JL	Chapter "RTT" added. Chapter "Related Software" * Section "GDB Server" Command line option "-strict" added. Command line option "-timeout" added.
V4.90d Rev. 0	141112	NG	Chapter "Related Software" * Section "J-Link Remote Server" updated. * Section "J-Scope" updated.
V4.90c Rev. 0	140924	JL	Chapter "Related Software" * Section "JTAGLoad" updated.
V4.90b Rev. 1	140813	EL	Chapter "Working with J-Link and J-Trace" * Section "Connecting multiple J-Links / J-Traces to your PC" updated Chapter "J-Link software" * Section "J-Link Configurator" updated.
V4.90b Rev. 0	140813	NG	Chapter "Related Software" * Section "J-Scope" added.
V4.86 Rev. 2	140606	AG	Chapter "Device specifics" * Section "Silicon Labs - EFM32 series devices" added
V4.86 Rev. 1	140527	JL	Chapter "Related Software" * Section "GDB Server" Command line options -halt / -nohalt added. Description for GDB Server CL version added.
V4.86 Rev. 0	140519	AG	Chapter "Flash download" Section "Mentor Sourcery CodeBench" added.
V4.84 Rev. 0	140321	EL	Chapter "Working with J-Link" * Section "Virtual COM Port (VCOM) improved. Chapter "Target interfaces and adapters" * Section "Pinout for SWD + Virtual COM Port (VCOM) added."

Revision	Date	By	Explanation
V4.82 Rev. 1	140228	EL	Chapter "Related Software" * Section "Command line options" Extended command line option -speed. Chapter "J-Link software and documentation package" * Section "J-Link STR91x Commander" Added command line option parameter to specify a customized scan-chain. Chapter "Working with J-Link" * Section "Virtual COM Port (VCOM) added. Chapter "Setup" * Section "Getting started with J-Link and DS-5" Chapter "Related Software"
V4.82 Rev. 0	140218	JL	* Section "GDB Server" Command line option -notimout added.
V4.80f Rev. 0	140204	JL	Chapter "Related Software" * Section "GDB Server" Command line options and remote commands added.
V4.80 Rev. 1	131219	JL/ NG	Chapter "Related Software" * Section "GDB Server" Remote commands and command line options description improved. Several corrections.
V4.80 Rev. 0	131105	JL	Chapter "Related Software" * Section "GDB Server" SEGGER-specific GDB protocol extensions added.
V4.76 Rev. 3	130823	JL	Chapter "Flash Download" * Replaced references to GDB Server manual. Chapter "Working withc J-Link" * Replaced references to GDB Server manual.
V4.76 Rev. 2	130821	JL	Chapter "Related Software" * Section "GDB Server" Remote commands added.
V4.76 Rev. 1	130819	JL	Chapter "Related Software" * Section "SWO Viewer" Sample code updated.
V4.76 Rev. 0	130809	JL	Chapter "Related Software" * Sections reordered and updated. Chapter "Setup" * Section "Using JLinkARM.dll moved here.
V4.71b Rev. 0	130507	JL	Chapter "Related Software" * Section "SWO Viewer" Added new command line options.
V4.66 Rev. 0	130221	JL	Chapter "Introduction" * Section "Supported OS" Added Linux and Mac OSX
V4.62b Rev. 0	130219	EL	Chapter "Introduction" * Section "J-Link / J-Trace models" Clock rise and fall times updated.
V4.62 Rev. 0	130129	JL	Chapter "Introduction" * Section "J-Link / J-Trace models" Sub-section "J-link ULTRA" updated.
V4.62 Rev. 0	130124	EL	Chapter "Target interfaces and adapters" * Section "9-pin JTAG/SWD connector" Pinout description corrected.

Revision	Date	By	Explanation
V4.58 Rev. 1	121206	AG	Chapter "Intoduction" * Section "J-Link / J-Trace models" updated.
V4.58 Rev. 0	121126	JL	Chapter "Working with J-Link" * Section "J-Link script files" Sub-section "Executing J-Link script files" updated.
V4.56b Rev. 0	121112	JL	Chapter "Related Software" * Section "J-Link SWO Viewer" Added sub-section "Configure SWO output after device reset"
V4.56a Rev. 0	121106	JL	Chapter "Related Software" * Section "J-Link Commander" Renamed "Commander script files" to "Commander files" and "script mode" to "batch mode".
V4.56 Rev. 0	121022	AG	Renamed "J-Link TCP/IP Server" to "J-Link Remote Server".
V4.54 Rev. 1	121009	JL	Chapter "Related Software" * Section "TCP/IP Server", subsection "Tunneling Mode" added.
V4.54 Rev. 0	120913	EL	Chapter "Flash Breakpoints" * Section "Licensing" updated. Chapter "Device specifics" * Section "Freescale", subsection "Data flash support" added.
V4.53c Rev. 0	120904	EL	Chapter "Licensing" * Section "Device-based license" updated.
V4.51h Rev. 0	120717	EL	Chapter "Flash download" * Section "J-Link commander" updated. Chapter "Support and FAQs" * Section "Frequently asked questions" updated. Chapter "J-Link and J-Trace related software" * Section "J-Link Commander" updated.
V4.51e Rev. 1	120704	EL	Chapter "Working with J-Link" * Section "Reset strategies" updated and corrected. Added reset type 8.
V4.51e Rev. 0	120704	AG	Chapter "Device specifics" * Section "ST" updated and corrected.
V4.51b Rev. 0	120611	EL	Chapter "J-Link and J-Trace related software" * Section "SWO Viewer" added.
V4.51a Rev. 0	120606	EL	Chapter "Device specifics" * Section "ST", subsection "ETM init" for some STM32 devices added * Section "Texas Instruments" updated. Chapter "Target interfaces and adapters" * Section "Pinout for SWD" updated.
V4.47a Rev. 0	120419	AG	Chapter "Device specifics" * Section "Texas Instruments" updated.
V4.46 Rev. 0	120416	EL	Chapter "Support" updated. Chapter "Working with J-Link"
V4.42 Rev. 0	120214	EL	* Section "J-Link script files" updated.

Revision	Date	By	Explanation
V4.36 Rev. 1	110927	EL	Chapter "Flash download" added. Chapter "Flash breakpoints" added. Chapter "Target interfaces and adapters" * Section "20-pin JTAG/SWD connector" updated. Chapter "RDI" added. Chapter "Setup" updated. Chapter "Device specifics" updated. Chapter "Working with J-Link"
V4.36 Rev. 0	110909	AG	* Section "J-Link script files" updated. Chapter "Introduction"
V4.26 Rev. 1	110513	KN	* Section "J-Link / J-Trace models" corrected.
V4.26 Rev. 0	110427	KN	Several corrections. Chapter "Introduction"
V4.24 Rev. 1	110228	AG	 * Section "J-Link / J-Trace models" corrected. Chapter "Device specifics" * Section "ST Microelectronics" updated.
V4.24 Rev. 0	110216	AG	Chapter "Device specifics" * Section "Samsung" added. Chapter "Working with J-Link" * Section "Reset strategies" updated. Chapter "Target interfaces and adapters" * Section "9-pin JTAG/SWD connector" added.
V4.23d	110202	AG	Chapter "J-Link and J-Trace related software" * Section "J-Link software and documentation package in detail" updated. Chapter "Introduction" * Section "Built-in intelligence for supported CPU-cores" added.
V4.21g	101130	AG	Chapter "Working with J-Link" * Section "Reset strategies" updated. Chapter "Device specifics" * Section "Freescale" updated. Chapter "Flash download and flash breakpoints * Section "Supported devices" updated * Section "Setup for different debuggers (CFI flash)" updated.
V4.21	101025	AG	Chapter "Device specifics" * Section "Freescale" updated.
V4.20j	101019	AG	Chapter "Working with J-Link" * Section "Reset strategies" updated.
V4.20b	100923	AG	Chapter "Working with J-Link" * Section "Reset strategies" updated.
90	100818	AG	Chapter "Working with J-Link" * Section "J-Link script files" updated. * Section "Command strings" upadted. Chapter "Target interfaces and adapters" * Section "19-pin JTAG/SWD and Trace connector" corrected. Chapter "Setup" * Section "J-Link configurator added."
89	100630	AG	Several corrections.
88	100622	AG	Chapter "J-Link and J-Trace related software" * Section "SWO Analyzer" added.
87	100617	AG	Several corrections.

Revision	Date	By	Explanation
86	100504	AG	Chapter "Introduction" * Section "J-Link / J-Trace models" updated. Chapter "Target interfaces and adapters" * Section "Adapters" updated.
85	100428	AG	Chapter "Introduction" * Section "J-Link / J-Trace models" updated.
84	100324	KN	Chapter "Working with J-Link and J-Trace" * Several corrections Chapter Flash download & flash breakpoints * Section "Supported devices" updated
83	100223	KN	Chapter "Introduction" * Section "J-Link / J-Trace models" updated.
82	100215	AG	Chapter "Working with J-Link" * Section "J-Link script files" added.
81	100202	KN	Chapter "Device Specifics" * Section "Luminary Micro" updated. Chapter "Flash download and flash breakpoints" * Section "Supported devices" updated.
80	100104	KN	Chapter "Flash download and flash breakpoints * Section "Supported devices" updated
79	091201	AG	Chapter "Working with J-Link and J-Trace" * Section "Reset strategies" updated. Chapter "Licensing" * Section "J-Link OEM versions" updated.
78	091023	AG	Chapter "Licensing" * Section "J-Link OEM versions" updated.
77	090910	AG	Chapter "Introduction" * Section "J-Link / J-Trace models" updated.
76	090828	KN	Chapter "Introduction" * Section" Specifications" updated * Section "Hardware versions" updated * Section "Common features of the J-Link product family" updated Chapter "Target interfaces and adapters" * Section "5 Volt adapter" updated
75	090729	AG	Chapter "Introduction" * Section "J-Link / J-Trace models" updated. Chapter "Working with J-Link and J-Trace" * Section "SWD interface" updated.
74	090722	KN	Chapter "Introduction" * Section "Supported IDEs" added * Section "Supported CPU cores" updated * Section "Model comparison chart" renamed to "Model comparison" * Section "J-Link bundle comparison chart" removed
73	090701	KN	Chapter "Introduction" * Section "J-Link and J-Trace models" added * Sections "Model comparison chart" & "J-Link bundle comparison chart"added Chapter "J-Link and J-Trace models" removed Chapter "Hardware" renamed to "Target interfaces & adapters" * Section "JTAG Isolator" added Chapter "Target interfaces and adapters" * Section "Target board design" updated Several corrections

Revision	Date	Ву	Explanation
72	090618	AG	Chapter "Working with J-Link" * Section "J-Link control panel" updated. Chapter "Flash download and flash breakpoints" * Section "Supported devices" updated. Chapter "Device specifics" * Section "NXP" updated.
71	090616	AG	Chapter "Device specifics" * Section "NXP" updated.
70	090605	AG	Chapter "Introduction" * Section "Common features of the J-Link product family" updated.
69	090515	AG	Chapter "Working with J-Link" * Section "Reset strategies" updated. * Section "Indicators" updated. Chapter "Flash download and flash breakpoints" * Section "Supported devices" updated.
68	090428	AG	Chapter "J-Link and J-Trace related software" * Section "J-Link STM32 Commander" added. Chapter "Working with J-Link" * Section "Reset strategies" updated.
67	090402	AG	Chapter "Working with J-Link" * Section "Reset strategies" updated.
66	090327	AG	Chapter "Background information" * Section "Embedded Trace Macrocell (ETM)" updated. Chapter "J-Link and J-Trace related software" * Section "Dedicated flash programming utilities for J-Link" updated.
65	090320	AG	Several changes in the manual structure.
64	090313	AG	Chapter "Working with J-Link" * Section "Indicators" added.
63	090212	AG	Chapter "Hardware" * Several corrections. * Section "Hardware Versions" Version 8.0 added.
62	090211	AG	Chapter "Working with J-Link and J-Trace" * Section "Reset strategies" updated. Chapter J-Link and J-Trace related software * Section "J-Link STR91x Commander (Command line tool)" updated. Chapter "Device specifics" * Section "ST Microelectronics" updated. Chapter "Hardware" updated.
61	090120	ΤQ	Chapter "Working with J-Link" * Section "Cortex-M3 specific reset strategies"
60	090114	AG	Chapter "Working with J-Link" * Section "Cortex-M3 specific reset strategies"
59	090108	KN	Chapter Hardware * Section "Target board design for JTAG" updated. * Section "Target board design for SWD" added.
58	090105	AG	Chapter "Working with J-Link Pro" * Section "Connecting J-Link Pro the first time" updated.

Revision	Date	Ву	Explanation
57	081222	AG	Chapter "Working with J-Link Pro" * Section "Introduction" updated. * Section "Configuring J-Link Pro via web interface" updated. Chapter "Introduction" * Section "J-Link Pro overview" updated.
56	081219	AG	Chapter "Working with J-Link Pro" * Section "FAQs" added. Chapter "Support and FAQs" * Section "Frequently Asked Questions" updated.
55	081218	AG	Chapter "Hardware" updated.
54	081217	AG	Chapter "Working with J-Link and J-Trace" * Section "Command strings" updated.
53	081216	AG	Chapter "Working with J-Link Pro" updated.
52	081212	AG	Chapter "Working with J-Link Pro" added. Chapter "Licensing" * Section "Original SEGGER products" updated.
51	081202	KN	Several corrections.
50	081030	AG	Chapter "Flash download and flash breakpoints" * Section "Supported devices" corrected.
49	081029	AG	Several corrections.
48	080916	AG	Chapter "Working with J-Link and J-Trace" * Section "Connecting multiple J-Links / J-Traces to your PC" updated.
47	080910	AG	Chapter "Licensing" updated.
46	080904	AG	Chapter "Licensing" added. Chapter "Hardware" Section "J-Link OEM versions" moved to chapter "Licensing"
45	080902	AG	Chapter "Hardware" Section "JTAG+Trace connector" JTAG+Trace connector pinout corrected. Section "J-Link OEM versions" updated.
44	080827	AG	Chapter "J-Link control panel" moved to chapter "Working with J-Link". Several corrections.
43	080826	AG	Chapter "Flash download and flash breakpoints" Section "Supported devices" updated.
42	080820	AG	Chapter "Flash download and flash breakpoints" Section "Supported devices" updated.
41	080811	AG	Chapter "Flash download and flash breakpoints" updated. Chapter "Flash download and flash breakpoints", section "Supported devices" updated.
40	080630	AG	Chapter "Flash download and flash breakpoints" updated. Chapter "J-Link status window" renamed to "J-Link control panel" Various corrections.
39	080627	AG	Chapter "Flash download and flash breakpoints" Section "Licensing" updated. Section "Using flash download and flash breakpoints with different debuggers" updated. Chapter "J-Link status window" added.

Revision	Date	By	Explanation
38	080618	AG	Chapter "Support and FAQs" Section "Frequently Asked Questions" updated Chapter "Reset strategies" Section "Cortex-M3 specific reset strategies" updated.
37	080617	AG	Chapter "Reset strategies" Section "Cortex-M3 specific reset strategies" updated.
36	080530	AG	Chapter "Hardware" Section "Differences between different versions" updated. Chapter "Working with J-Link and J-Trace" Section "Cortex-M3 specific reset strategies" added.
35	080215	AG	Chapter "J-Link and J-Trace related software" Section "J-Link software and documentation package in detail" updated.
34	080212	AG	Chapter "J-Link and J-Trace related software" Section "J-Link TCP/IP Server (Remote J-Link / J-Trace use)" updated. Chapter "Working with J-Link and J-Trace" Section "Command strings" updated. Chapter "Flash download and flash breakpoints" Section "Introduction" updated. Section "Licensing" updated. Section "Using flash download and flash breakpoints with different debuggers" updated.
33	080207	AG	Chapter "Flash download and flash breakpoints" added Chapter "Device specifics:" Section "ATMEL - AT91SAM7 - Recommended init sequence" added.
32	0080129	SK	Chapter "Device specifics": Section "NXP - LPC - Fast GPIO bug" list of device enhanced.
31	0080103	SK	Chapter "Device specifics": Section "NXP - LPC - Fast GPIO bug" updated.
30	071211	AG	Chapter "Device specifics": Section "Analog Devices" updated. Section "ATMEL" updated. Section "Freescale" added. Section "Luminary Micro" added. Section "NXP" updated. Section "OKI" added. Section "OKI" added. Section "ST Microelectronics" updated. Section "Texas Instruments" updated. Chapter "Related software": Section "J-Link STR91x Commander" updated
29	070912	SK	Chapter "Hardware", section "Target board design" updated.
28	070912	SK	Chapter "Related software": Section "J-LinkSTR91x Commander" added. Chapter "Device specifics": Section "ST Microelectronics" added. Section "Texas Instruments" added. Subsection "AT91SAM9" added.

Revision	Date	By	Explanation
28	070912	AG	Chapter "Working with J-Link/J-Trace": Section "Command strings" updated.
27	070827	то	Chapter "Working with J-Link/J-Trace":
27	0/082/	ΤQ	Section "Command strings" updated.
26	070710	SK	Chapter "Introduction": Section "Features of J-Link" updated. Chapter "Background Information": Section "Embedded Trace Macrocell" added. Section "Embedded Trace Buffer" added.
25	070516	SK	Chapter "Working with J-Link/J-Trace": Section "Reset strategies in detail" - "Software, for Analog Devices ADuC7xxx MCUs" updated - "Software, for ATMEL AT91SAM7 MCUs" added. Chapter "Device specifics" Section "Analog Devices" added. Section "ATMEL" added.
24	070323	SK	Chapter "Setup": "Uninstalling the J-Link driver" updated. "Supported ARM cores" updated.
23	070320	SK	Chapter "Hardware": "Using the JTAG connector with SWD" updated.
22	070316	SK	Chapter "Hardware": "Using the JTAG connector with SWD" added.
21	070312	SK	Chapter "Hardware": "Differences between different versions" supplemented.
20	070307	SK	Chapter "J-Link / J-Trace related software": "J-Link GDB Server" licensing updated.
19	070226	SK	Chapter "J-Link / J-Trace related software" updated and reorganized. Chapter "Hardware" "List of OEM products" updated
18	070221	SK	Chapter "Device specifics" added Subchapter "Command strings" added
17	070131	SK	Chapter "Hardware": "Version 5.3": Current limits added "Version 5.4" added Chapter "Setup": "Installating the J-Link USB driver" removed. "Installing the J-Link software and documentation pack" added. Subchapter "List of OEM products" updated. "OS support" updated
16	061222	SK	Chapter "Preface": "Company description" added. J-Link picture changed.
15	060914	00	Subchapter 1.5.1: Added target supply voltage and target supply current to specifications. Subchapter 5.2.1: Pictures of ways to connect J-Trace.
14	060818	ΤQ	Subchapter 4.7 "Using DCC for memory reads" added.
13	060711	00	Subchapter 5.2.2: Corrected JTAG+Trace connector pinout table.
12	060628	00	Subchapter 4.1: Added ARM966E-S to List of supported ARM cores.

Revision	Date	By	Explanation
11	060607	SK	Subchapter 5.5.2.2 changed. Subchapter 5.5.2.3 added.
10	060526	SK	ARM9 download speed updated. Subchapter 8.2.1: Screenshot "Start sequence" updated. Subchapter 8.2.2 "ID sequence" removed. Chapter "Support" and "FAQ" merged. Various improvements
9	060324	00	Chapter "Literature and references" added. Chapter "Hardware": Added common information trace signals. Added timing diagram for trace. Chapter "Designing the target board for trace" added.
8	060117	00	Chapter "Related Software": Added JLinkARM.dll. Screenshots updated.
7	051208	00	Chapter Working with J-Link: Sketch added.
6	051118	00	Chapter Working with J-Link: "Connecting multiple J-Links to your PC" added. Chapter Working with J-Link: "Multi core debug- ging" added. Chapter Background information: "J-Link firm- ware" added.
5	051103	ΤQ	Chapter Setup: "JTAG Speed" added.
4	051025	00	Chapter Background information: "Flash program- ming" added. Chapter Setup: "Scan chain configuration" added. Some smaller changes.
3	051021	ΤQ	Performance values updated.
2	051011	ΤQ	Chapter "Working with J-Link" added.
1	050818	ΤW	Initial version.

About this document

Assumptions

This document assumes that you already have a solid knowledge of the following:

- The software tools used for building your application (assembler, linker, C compiler)
- The C programming language
- The target processor
- DOS command line

If you feel that your knowledge of C is not sufficient, we recommend The C Programming Language by Kernighan and Richie (ISBN 0-13-1103628), which describes the standard in C-programming and, in newer editions, also covers the ANSI C standard.

How to use this manual

This manual explains all the functions and macros that the product offers. It assumes you have a working knowledge of the C language. Knowledge of assembly programming is not required.

Typographic conventions for syntax

Used for Style Bodv Body text. Text that you enter at the command-prompt or that appears on Keyword the display (that is system functions, file- or pathnames). Parameters in API functions. Parameter Sample code in program examples. Sample Comments in programm examples. Sample comment Reference to chapters, sections, tables and figures or other docu-Reference ments. **GUIElement** Buttons, dialog boxes, menu names, menu commands. Emphasis Very important sections.

This manual uses the following typographic conventions:

Table 1.1: Typographic conventions

SEGGER Microcontroller GmbH & Co. KG develops and distributes software development tools and ANSI C software components (middleware) for embedded systems in several industries such as telecom, medical technology, consumer electronics, automotive industry and industrial automation.

SEGGER's intention is to cut software development time for embedded applications by offering compact flexible and easy to use middleware, allowing developers to concentrate on their application.

Our most popular products are emWin, a universal graphic software package for embedded applications, and embOS, a small yet efficient real-time kernel. emWin, written entirely in ANSI C, can easily be used on any CPU and most any display. It is complemented by the available PC tools: Bitmap Converter, Font Converter, Simulator and Viewer. embOS supports most 8/16/32-bit CPUs. Its small memory footprint makes it suitable for single-chip applications.

Apart from its main focus on software tools, SEGGER develops and produces programming tools for flash micro controllers, as well as J-Link, a JTAG emulator to assist in development, debugging and production, which has rapidly become the industry standard for debug access to ARM cores.

Corporate Office: http://www.segger.com

EMBEDDED SOFTWARE (Middleware)

emWin

embOS

Graphics software and GUI emWin is designed to provide an efficient, processor- and display controller-independent graphical user interface (GUI) for any application that operates with a graphical display.

Real Time Operating System

embOS is an RTOS designed to offer the benefits of a complete multitasking system for hard real time applications with minimal resources.

embOS/IP TCP/IP stack

embOS/IP a high-performance TCP/IP stack that has been optimized for speed, versatility and a small memory footprint.

emFile File system

emFile is an embedded file system with

FAT12, FAT16 and FAT32 support. Various Device drivers, e.g. for NAND and NOR flashes, SD/MMC and Compact-Flash cards, are available.

USB-Stack

USB device/host stack

A USB stack designed to work on any embedded system with a USB controller. Bulk communication and most standard device classes are supported.

SEGGER TOOLS

Flasher

Flash programmer Flash Programming tool primarily for micro controllers.

J-Link

JTAG emulator for ARM cores USB driven JTAG interface for ARM cores.

J-Trace

JTAG emulator with trace

USB driven JTAG interface for ARM cores with Trace memory. supporting the ARM ETM (Embedded Trace Macrocell).

J-Link / J-Trace Related Software

Add-on software to be used with SEGGER's industry standard JTAG emulator, this includes flash programming software and flash breakpoints.

Chapter 1 Introduction

This chapter gives a short overview about J-Link and J-Trace.

1.1 Requirements

Host System

To use J-Link or J-Trace you need a host system running Windows 2000 or later. For a list of all operating systems which are supported by J-Link, please refer to *Supported OS* on page 27.

Target System

A target system with a supported CPU is required.

You should make sure that the emulator you are looking at supports your target CPU. For more information about which J-Link features are supported by each emulator, please refer to *Model comparison* on page 29.

1.2 Supported OS

J-Link/J-Trace can be used on the following operating systems:

- Microsoft Windows 2000
- Microsoft Windows XP
- Microsoft Windows XP x64
- Microsoft Windows Vista
- Microsoft Windows Vista x64
- Windows 7
- Windows 7 x64
- Windows 8
- Windows 8 x64
- Windows 10
- Linux
- Mac OSX 10.5 and higher

1.3 J-Link / J-Trace models

J-Link / J-Trace is available in different variations, each designed for different purposes / target devices. Currently, the following models of J-Link / J-Trace are available:

- J-Link BASE
- J-Link PLUS
- J-Link PRO
- J-Link ULTRA+
- J-Trace ARM
- J-Trace for Cortex-M

In the following, the different J-Link / J-Trace models are described and the changes between the different hardware versions of each model are listed. To determine the hardware version of your J-Link / J-Trace, the first step should be to look at the label at the bottom side of the unit. J-Links / J-Traces have the hardware version printed on the back label.

If this is not the case with your J-Link / J-Trace, start $_{JLink.exe}$. As part of the initial message, the hardware version is displayed.

1.3.1 Model comparison

The following tables show the features which are included in each J-Link / J-Trace model.

Hardware features

	J-Link BASE	J-Link PLUS	J-Link ULTRA+	J-Link PRO	J-Trace for Cortex-M	J-Trace ARM
USB	yes	yes	yes	yes	yes	yes
Ethernet	no	no	no	yes	no	no
Supported cores		5/A8/A9/F 0/M0+/M			Tracing: Cortex-M3/M4 No tracing: ARM7/9/11, Cortex-M0/M0+/ M1 Cortex-A5/A8/ A9/R4	ARM 7/9
JTAG	yes	yes	yes	yes	yes	yes
SWD	yes	yes	yes	yes	yes	no
SWO	yes	yes	yes	yes	yes	no
ETM Trace	no	no	no	no	yes	yes

Software features

Software features are features implemented in the software running on the host. Software features can either come with the J-Link or be added later using a license string from Segger.

	J-Link BASE	J-Link PLUS	J-Link ULTRA+	J-Link PRO	J-Trace for Cortex-M	J-Trace ARM
J-Flash	yes(opt)	yes	yes	yes	yes	yes
Flash breakpoints ¹	yes(opt)	yes	yes	yes	yes	yes
Flash download ²	yes	yes	yes	yes	yes	yes
GDB Server	yes	yes	yes	yes	yes	yes
RDI	yes(opt)	yes	yes	yes	yes	yes

¹ In order to use the flash breakpoints with J-Link no additional license for flash download is required. The flash breakpoint feature allows setting an unlimited number of breakpoints even if the application program is not located in RAM, but in flash memory. Without this feature, the number of breakpoints which can be set in flash is limited to the number of hardware breakpoints (typically two for ARM 7/9, up to six for Cortex-M) For more information about flash breakpoints, please refer to *Flash breakpoints* on page 263.

² Most IDEs come with its own flashloaders, so in most cases this feature is not essential for debugging applications in flash. The J-Link flash download feature is mainly used in debug environments where the debugger does not come with an own flashloader (for example, the GNU Debugger). For more information about how flash download via FlashDL works, please refer to *Flash download* on page 247.

Introduction

1.3.2 J-Link BASE

J-Link BASE is a JTAG emulator designed for ARM cores. It connects via USB to a PC running Microsoft Windows 2000 or later. For a complete list of all operating systems which are supported, please refer to *Supported OS* on page 27. J-Link BASE has a built-in 20-pin JTAG connector, which is compatible with the standard 20-pin connector defined by ARM.

1.3.2.1 Additional features

- Direct download into flash memory of most popular microcontrollers supported
- Full-speed USB 2.0 interface
- Serial Wire Debug supported
- Serial Wire Viewer supported
- Download speed up to 1 MBytes/second*
- Debug interface (JTAG/SWD/...) speed up to 15 MHz
 RDI interface available, which allows using J-Link with RDI
- compliant software

*The actual speed depends on various factors, such as JTAG/ SWD, clock speed, host CPU core etc.

1.3.2.2 Specifications

The following table gives an overview about the specifications (general, mechanical, electrical) for J-Link BASE.

General				
Supported OS	For a complete list of all operating sys- tems which are supported, please refer to <i>Supported OS</i> on page 27.			
Electromagnetic compatibility (EMC)	EN 55022, EN 55024			
Operating temperature	+5°C +60°C			
Storage temperature	-20°C +65 °C			
Relative humidity (non-condensing)	Max. 90% rH			
Мес	chanical			
Size (without cables)	100mm x 53mm x 27mm			
Weight (without cables)	70g			
Availab	e interfaces			
USB interface	USB 2.0, full speed			
Target interface	JTAG 20-pin (14-pin adapter available)			
JTAG/SWD In	terface, Electrical			
Power supply	USB powered Max. 50mA + Target Supply current.			
Target interface voltage (V_{IF})	1.2V 5V			
Target supply voltage	4.5V 5V (if powered with 5V on USB)			
Target supply current	Max. 300mA			
Reset Type	Open drain. Can be pulled low or tristated.			
Reset low level output voltage (V _{OL})	$V_{OL} \le 10\%$ of V_{IF}			
For the whole target volt	age range (1.2V <= V _{IF} <= 5V)			
LOW level input voltage (V_{IL})	$V_{IL} <= 40\%$ of V_{IF}			
able 1.1: J-Link specifications				

Table 1.1: J-Link specifications

HIGH level input voltage (V_{IH})	$V_{IH} >= 60\%$ of V_{IF}			
For 1.8V <= V _{IF} <= 3.6V				
LOW level output voltage (V _{OL}) with a load of 10 kOhm	$V_{OL} \le 10\%$ of V_{IF}			
HIGH level output voltage (V _{OH}) with a load of 10 kOhm	$V_{OH} >= 90\%$ of V_{IF}			
For 3.6 <=	= V _{IF} <= 5V			
LOW level output voltage (V _{OL}) with a load of 10 kOhm	$V_{OL} \le 20\%$ of V_{IF}			
HIGH level output voltage (V _{OH}) with a load of 10 kOhm	$V_{OH} >= 80\%$ of V_{IF}			
JTAG/SWD Int	erface, Timing			
SWO sampling frequency	Max. 7.5 MHz			
Data input rise time (T _{rdi})	T _{rdi} <= 20ns			
Data input fall time (T _{fdi})	T _{fdi} <= 20ns			
Data output rise time (T _{rdo})	T _{rdo} <= 10ns			
Data output fall time (T _{fdo})	T _{fdo} <= 10ns			
Clock rise time (T _{rc})	T _{rc} <= 3ns			
Clock fall time (T _{fc})	T _{fc} <= 3ns			
Table 1 1: 1-1 ink specifications				

Table 1.1: J-Link specifications

1.3.2.3 Hardware versions

Versions 1-4 (Obsolete)

Obsolete.

Version 5.0 (Obsolete)

Identical to version 4.0 with the following exception:

- Uses a 32-bit RISC CPU.
- Maximum download speed (using DCC) is over 700 Kbytes/second.
- JTAG speed: Maximum JTAG frequency is 12 MHz; possible JTAG speeds are: 48 MHz / n, where n is 4, 5, ..., resulting in speeds of:
 - 12.000 MHz (n = 4)
 - 9.600 MHz (n = 5)
 - 8.000 MHz (n = 6)
 - 6.857 MHz (n = 7)
 - 6.000 MHz (n = 8)
 - 5.333 MHz (n = 9)
 - 4.800 MHz (n = 10)
- Supports adaptive clocking.

Version 5.2 (Obsolete)

Identical to version 5.0 with the following exception:

• Target interface: RESET is open drain.

Version 5.3 (Obsolete)

Identical to version 5.2 with the following exception:

 5V target supply current limited 5V target supply (pin 19) of Kick-Start versions of J-Link is current monitored and limited. J-Link automatically switches off 5V supply in case of over-current to protect both J-Link and host computer. Peak current (<= 10 ms) limit is 1A, operating current limit is 300mA.

Version 5.4 (Obsolete)

Identical to version 5.3 with the following exception:

• Supports 5V target interfaces.

Version 6.0 (Obsolete)

Identical to version 5.4 with the following exception:

- Outputs can be tristated (Effectively disabling the JTAG interface)
- Supports SWD interface.
- SWD speed: Software implementation. 4 MHz maximum SWD speed.
- J-Link supports SWV (Speed limited to 500 kHz)

Version 7.0 (Obsolete)

Identical to version 6.0 with the following exception:

• Uses an additional pin to the UART unit of the target hardware for SWV support (Speed limited to 6 MHz).

Version 8.0

Identical to version 7.0 with the following exception:

• SWD support for non-3.3V targets.

Version 9.1

• New design based on STM32F205.

Version 9.2

Identical to version 9.1 with the following exception:

• Pin 1 (VTref) is used for measuring target reference voltage only. Buffers on J-Link side are no longer powered through this pin but via the J-Link internal voltage supplied via USB.

Table 1.2: J-Link BASE hardware versions

1.3.3 J-Link PLUS

J-Link PLUS is a JTAG emulator designed for ARM cores. It connects via USB to a PC running Microsoft Windows 2000 or later. For a complete list of all operating systems which are supported, please refer to *Supported OS* on page 27. J-Link PLUS has a built-in 20-pin JTAG connector, which is compatible with the standard 20-pin connector defined by ARM. J-Link PLUS comes with licenses for all J-Link related SEGGER software.

1.3.3.1 Additional features

- Direct download into flash memory of most popular microcontrollers supported
- Full-speed USB 2.0 interface
- Serial Wire Debug supported
- Serial Wire Viewer supported
- Download speed up to 1 MBytes/second*
- Debug interface (JTAG/SWD/...) speed up to 15 MHz
- RDI interface available, which allows using J-Link with RDI compliant software
- Comes with built-in licenses for: Unlimited number of breakpoints in flash (FlashBP), J-Link GDBServer, J-Link RDI, J-Link RDDI and J-Flash (production programming software).

*The actual speed depends on various factors, such as JTAG/SWD, clock speed, host CPU core etc.

1.3.3.2 Specifications

The following table gives an overview about the specifications (general, mechanical, electrical) for J-Link PLUS.

General							
Supported OS	For a complete list of all operating sys- tems which are supported, please refer to <i>Supported OS</i> on page 27.						
Electromagnetic compatibility (EMC)	EN 55022, EN 55024						
Operating temperature	+5°C +60°C						
Storage temperature	-20°C +65 °C						
Relative humidity (non-condensing)	Max. 90% rH						
Mech	nanical						
Size (without cables)	100mm x 53mm x 27mm						
Weight (without cables)	70g						
Available interfaces							
USB interface	USB 2.0, full speed						
Target interface	JTAG 20-pin (14-pin adapter available)						
JTAG/SWD Inte	erface, Electrical						
Power supply	USB powered Max. 50mA + Target Supply current.						
Target interface voltage (V _{IF})	1.2V 5V						
Target supply voltage	4.5V 5V (if powered with 5V on USB)						
Target supply current	Max. 300mA						
Reset Type	Open drain. Can be pulled low or tristated.						

Table 1.3: J-Link specifications

$V_{OL} \le 10\%$ of V_{IF}			
For the whole target voltage range (1.2V <= V _{IF} <= 5V)			
$V_{IL} \le 40\%$ of V_{IF}			
$V_{IH} >= 60\%$ of V_{IF}			
V _{IF} <= 3.6V			
$V_{OL} \le 10\%$ of V_{IF}			
$V_{OH} >= 90\%$ of V_{IF}			
= V _{IF} <= 5V			
$V_{OL} \le 20\%$ of V_{IF}			
$V_{OH} >= 80\%$ of V_{IF}			
erface, Timing			
Max. 7.5 MHz			
T _{rdi} <= 20ns			
T _{fdi} <= 20ns			
T _{rdo} <= 10ns			
T _{fdo} <= 10ns			
T _{rc} <= 3ns			
– –			
T _{fc} <= 3ns			

1.3.3.3 Hardware versions

Version 9.1

• Initial design based on STM32F205.

Version 9.2

Identical to version 9.1 with the following exception:

• Pin 1 (VTref) is used for measuring target reference voltage only. Buffers on J-Link side are no longer powered through this pin but via the J-Link internal voltage supplied via USB.

1.3.4 J-Link ULTRA+

J-Link ULTRA+ is a JTAG/SWD emulator designed for ARM/Cortex and other supported CPUs. It is fully compatible to the standard J-Link and works with the same PC software. Based on the highly optimized and proven J-Link, it offers even higher speed as well as target power measurement capabilities due to the faster CPU, built-in FPGA and High speed USB interface. It connects via USB to a PC running Microsoft Windows 2000 or later. For a complete list of all operating systems which are supported, please refer to Supported OS on page 25. J-link ULTRA+ has a built-in 20-pin JTAG/SWD connector.

1.3.4.1 Additional features

- Fully compatible to the standard J-Link
- Very high performance for all supported CPU cores
- Hi-Speed USB 2.0 interface
- Download speed up to 3 MByte/second*
- Debug interface (JTAG/SWD/...) speed up to 15 MHz
- Serial Wire Debug (SWD) supported
- Serial Wire Viewer (SWV) supported
- SWO sampling frequenciés up to 100 MHz
- Serial Wire Output (SWO) supported
- Target power can be supplied
- Comes with built-in licenses for: Unlimited number of breakpoints in flash (FlashBP), J-Link GDBServer, J-Link RDI, J-Link RDDI and J-Flash (production programming software).
- Target power consumption can be measured with high accuracy.

*The actual speed depends on various factors, such as JTAG/SWD, clock speed, host CPU core etc.

1.3.4.2 Specifications

The following table gives an overview about the specifications (general, mechanical, electrical) for J-link ULTRA+. All values are valid for J-link ULTRA hardware version 1.

Note: Some specifications, especially speed, are likely to be improved in the future with newer versions of the J-Link software (freely available).

1.3.5 J-Link PRO

J-Link PRO is a JTAG emulator designed for ARM cores. It is fully compatible to J-Link and connects via Ethernet/USB to a PC running Microsoft Windows 2000 or later, Linux or Mac OS X. For a complete list of all operating systems which are supported, please refer to Supported OS on page 25. J-Link PRO comes with licenses for all J-Link related SEGGER software.

1.3.5.1 Additional features

- Fully compatible to J-Link
- More memory for future firmware extensions (ARM11, X-Scale, Cortex R4 and Cortex A8)
- Additional LEDs for power and RESET indication
- Comes with web interface for easy TCP/IP configuration (built-in web server)
- Serial Wire Debug supported
- Serial Wire Viewer supported
- Download speed up to 3 MByte/second
- Comes with built-in licenses for: Unlimited number of breakpoints in flash (FlashBP), J-Link GDBServer, J-Link RDI, J-Link RDDI and J-Flash (production programming software).
- Embedded Trace Buffer (ETB) support
- Galvanic isolation from host via Ethernet

1.3.5.2 Hardware versions

Version 1.1

Compatible to J-Link.

 Provides an additional Ethernet interface which allows to communicate with J-Link via TCP/IP.

Version 3

Identical to version 1.1 with the following exception:

• SWD support for non-3.3V targets.

Version 4

• New design based on STM32F407 + FPGA (Cyclone IV)Version 4.3

Identical to version 4 with the following exception:

• Pin 1 (VTref) is used for measuring target reference voltage only. Buffers on J-Link side are no longer powered through this pin but via the J-Link internal voltage supplied via USB.

1.3.6 J-Link Lite ARM

J-Link Lite ARM is a fully functional OEM-version of J-Link. If you are selling evaluation-boards, J-Link Lite ARM is an inexpensive emulator solution for you. Your customer receives a widely acknowledged debug probe which allows to start right away with development.

1.3.6.1 Additional features

- Very small form factor
- Fully software compatible to J-Link
- Supports any ARM7/9/11, Cortex-A5/A8/A9, Cortex-M0/M0+/M1/M3/M4, Cortex-R4/R5 core
- JTAG clock up to 4 MHz
- SWD, SWO supported for Cortex-M devices
- Flash download into supported MCUs
- Standard 20-pin 0.1 inch JTAG connector (compatible to J-Link)

1.3.6.2 Specifications

The following table gives an overview about the specifications (general, mechanical, electrical) for J-Link Lite ARM. All values are valid for J-Link hardware version 8.

General		
Supported OS	For a complete list of all operating sys- tems which are supported, please refer to <i>Supported OS</i> on page 27.	
Electromagnetic compatibility (EMC)	EN 55022, EN 55024	
Operating temperature	+5°C +60°C	
Storage temperature	-20°C +65 °C	
Relative humidity (non-condensing)	Max. 90% rH	
Size (without cables)	28mm x 26mm x 7mm	
Weight (without cables)	6g	
Mech	anical	
USB interface	USB 2.0, full speed

Clock rise time (T _{rc})	Max. 10ns	
Clock fall time (T _{fc})	Max. 10ns	

Table 1.8: J-Link Lite specifications

1.3.7 J-Link Lite CortexM

J-Link Lite CortexM is a specific OEM-version of SEGGER J-Link Lite which is designed to be used with Cortex-M devices. If you are selling evaluation-boards, J-Link Lite CortexM is an inexpensive emulator solution for you. Your customer receives a

widely acknowledged JTAG/SWD-emulator which allows to start right away with development.

- Very small form factor
- Fully software compatible to J-Link
- Any Cortex-M0/M0+/M1/M3/M4 core supported
- JTAG clock up to 4 MHz
- SWD, SWO supported
- Flash download into supported MCUs
- Standard 9- or 19-pin 0.05" Samtec FTSH connector
- 3.3V target interface voltage

1.3.7.1 Specifications

The following table gives an overview about the specifications (general, mechanical, electrical) for J-Link Lite Cortex-M.

General		
Supported OS	For a complete list of all operating sys- tems which are supported, please refer to <i>Supported OS</i> on page 27.

Introduction

1.3.8 J-Trace ARM

J-Trace ARM is a JTAG emulator designed for ARM cores which includes trace (ETM) support. It connects via USB to a PC running Microsoft Windows 2000 or later. For a complete list of all operating systems which are supported, please refer to Supported OS on page 25. J-Trace has a built-in 20-pin JTAG connector and a built in 38-pin JTAG+Trace connector, which are compatible to the standard 20-pin connector and 38-pin connector defined by ARM.

1.3.8.1 Additional features

- Supports tracing on ARM7/9 targets
- JTAG speed up to 12 MHz
- Download speed up to 420 Kbytes/second *
- DCC speed up to 600 Kbytes/second *
- Comes with built-in licenses for: Unlimited number of breakpoints in flash (FlashBP), J-Link GDBServer, J-Link RDI, J-Link RDDI and J-Flash (production programming software).
- * Measured with J-Trace, ARM7 @ 50 MHz, 12MHz JTAG speed.

1.3.8.2 Specifications

General		
Supported OS	For a complete list of all operating sys- tems which are supported, please refer to <i>Supported OS</i> on page 27.	
Electromagnetic Compatibility (EMC)	EN 55022, EN 55024	
Operating Temperature	+5°C +40°C	
Storage Temperature	-20°C +65 °C	
Relative Humidity (non-condensing)	<90% rH	
Size (without cables)	123mm x 68mm x 30mm	
Weight (without cables)	120g	
Mechanical		
USB Interface	USB 2.0, full speed	
Target Interface	JTAG 20-pin (14-pin adapter available) JTAG+Trace: Mictor, 38-pin	
JTAG/SWD Interface, Electrical		
Power Supply	USB powered < 300mA	
Supported Target interface voltage	3.0 - 3.6 V (5V adapter available)	

Table 1.10: J-Trace specifications

1.3.8.3 Download speed

The following table lists performance values (Kbytes/s) for writing to memory (RAM):

Hardware	ARM7 <i>via JTAG</i>	ARM9 <i>via JTAG</i>
		280.0 Kbytes/s (12MHz JTAG)

 Table 1.11: Download speed differences between hardware revisions

All tests have been performed in the testing environment which is described on *Measuring download speed* on page 446.

The actual speed depends on various factors, such as JTAG, clock speed, host CPU core etc.

1.3.8.4 Hardware versions

Version 1

This J-Trace uses a 32-bit RISC CPU. Maximum download speed is approximately 420 KBytes/second (600 KBytes/second using DCC).

1.3.9 J-Trace for Cortex-M

J-Trace for Cortex-M is a JTAG/SWD emulator designed for Cortex-M cores which includes trace (ETM) support. J-Trace for Cortex-M can also be used as a J-Link and it also supports ARM7/9 cores. Tracing on ARM7/9 targets is not supported.

1.3.9.1 Additional features

- Has all the J-Link functionality
- Supports tracing on Cortex-M targets
- Comes with built-in licenses for: Unlimited number of breakpoints in flash (FlashBP), J-Link GDBServer, J-Link RDI, J-Link RDDI and J-Flash (production programming software).

1.3.9.2 Specifications

The following table gives an overview about the specifications (general, mechanical, electrical) for J-Trace for Cortex-M. All values are valid for the latest hardware version of J-Trace for Cortex-M.

General		
Supported OS	For a complete list of all operating sys- tems which are supported, please refer to Supported OS on page 19.

Trace Interface, Timing		
TRACECLK low pulse width (T _{wl})	Min. 2ns	
TRACECLK high pulse width (T _{wh})	Min. 2ns	
Data rise time (T _{rd})	Max. 3ns	
Data fall time (T _{fd})	Max. 3ns	
Clock rise time (T _{rc})	Max. 3ns	
Clock fall time (T _{fc})	Max. 3ns	
Data setup time (T _s)	Min. 3ns	
Data hold time (T _h)	Min. 2ns	

Table 1.12: J-Trace for Cortex-M3 specifications

1.3.9.3 Download speed

The following table lists performance values (Kbytes/s) for writing to memory (RAM):

Hardware	Cortex-M3
J-Trace for Cortex-M3 V2	190 Kbytes/s (12MHz SWD) 760 KB/s (12 MHz JTAG)
J-Trace for Cortex-M V3.1	190 Kbytes/s (12MHz SWD) 1440 KB/s (25 MHz JTAG)

Table 1.13: Download speed differences between hardware revisions

The actual speed depends on various factors, such as JTAG, clock speed, host CPU core etc.

1.3.9.4 Hardware versions

Version 2

Obsolete.

Version 3.1

Identical to version 2.0 with the following exceptions:

- Hi-Speed USB
- Voltage range for trace signals extended to 1.2 3.3 V
- Higher download speed

1.3.10 Flasher ARM

Flasher ARM is a programming tool for microcontrollers with onchip or external Flash memory and ARM core. Flasher ARM is designed for programming flash targets with the J-Flash software or stand-alone. In addition to that Flasher ARM has all of the J-Link functionality. For more information about Flasher ARM, please refer to UM08007, Flasher ARM User's Guide.

1.3.10.1 Specifications

The following table gives an overview about the specifications (general, mechanical, electrical) for Flasher ARM.

Ge	neral	
Supported OS	For a complete list of all operating sys- tems which are supported, please refer to Supported OS on page 19.	
Mecl	nanical	
USB interface	USB 2.0, full speed	
Target interface	JTAG/SWD 20-pin	
JTAG Interf	ace, Electrical	
Power supply	USB powered Max. 50mA + Target Supply current.	
Target interface voltage (V_{IF})	1.2V 5V	
Target supply voltage	4.5V 5V (if powered with 5V on USB)	
Target supply current	Max. 300mA	
For the whole target voltage range (1.8V <= V _{IF} <= 5V)		
LOW level input voltage (V _{IL})	Max. 40% of V _{IF}	
HIGH level input voltage (V _{IH})	Min. 60% of V _{IF}	
For 1.8V <	= V _{IF} <= 3.6V	
LOW level output voltage (V _{OL}) with a load of 10 kOhm	Max. 10% of $\rm V_{\rm IF}$	
HIGH level output voltage (V _{OH}) with a load of 10 kOhm	Min. 90% of V _{IF}	
For 3.6 <= V _{IF} <= 5V		
LOW level output voltage (V _{OL}) with a load of 10 kOhm	Max. 20% of $V_{\rm IF}$	
HIGH level output voltage (V _{OH}) with a load of 10 kOhm	Min. 80% of V _{IF}	
SWD Interface, Electrical		
Power supply	USB powered Max. 50mA + Target Supply current.	
Target interface voltage (V _{IF})	1.2V 5V (SWD interface is 5V tolerar but can output a maximum of 3.3V SWI signals)	
Target supply voltage	4.5V 5V (if powered with 5V on USB	

Target supply current	Max. 300mA	
LOW level input voltage (V_{IL})	Max. 0.8V	
HIGH level input voltage (V_{IH})	Min. 2.0V	
LOW level output voltage (V_{OL}) with a	Max. 0.5V	
load of 10 kOhm		
HIGH level output voltage (V _{OH}) with a	Min. 2.85V	
load of 10 kOhm	MIII. 2.05V	
Table 1.15: Flasher ARM specifications		

1.4 Common features of the J-Link product family

- USB 2.0 interface (Full-Speed/Hi-Speed, depends on J-Link model)
- Any ARM7/9/11 (including thumb mode), Cortex-A5/A8, Cortex-M0/M1/M3/M4, Cortex-R4 core supported
- Automatic core recognition
- Maximum JTAG speed 12/25 MHz (depends on J-Link model)
- Seamless integration into all major IDEs (<u>https://segger.com/jlink-ide-integra-tion.html</u>)
- No power supply required, powered through USB
- Support for adaptive clocking
- All JTAG signals can be monitored, target voltage can be measured
- Support for multiple devices
- Fully plug and play compatible
- Standard 20-pin JTAG/SWD connector, 19-pin JTAG/SWD and Trace connector, standard 38-pin JTAG+Trace connector
- USB and 20-pin ribbon cable included
- Memory viewer (J-Mem) included
- Remote server included, which allows using J-Trace via TCP/IP networks
- RDI interface available, which allows using J-Link with RDI compliant software
- Flash programming software (J-Flash) available
- Flash DLL available, which allows using flash functionality in custom applications
- Software Developer Kit (SDK) available
- Full integration with the IAR C-SPY® debugger; advanced debugging features available from IAR C-SPY debugger.
- 14-pin JTAG adapter available
- J-Link 19-pin Cortex-M Adapter available
- J-Link 9-pin Cortex-M Adapter available
- Adapter for 5V JTAG targets available for hardware revisions up to 5.3
- Optical isolation adapter for JTAG/SWD interface available
- Target power supply via pin 19 of the JTAG/SWD interface (up to 300 mA to target with overload protection), alternatively on pins 11 and 13 of the Cortex-M 19-pin trace connector

1.5 Supported CPU cores

J-Link / J-Trace has been tested with the following cores, but should work with any ARM7/9/11, Cortex-M0/M1/M3/M4 and Cortex-A5/A8/A9/R4 core. If you experience problems with a particular core, do not hesitate to contact Segger.

- ARM7TDMI (Rev 1)
- ARM7TDMI (Rev 3)
- ARM7TDMI-S (Rev 4)
- ARM720T
- ARM920T
- ARM922T
- ARM926EJ-S
- ARM946E-S
- ARM966E-S
- ARM1136JF-S
- ARM1136J-S
- ARM1156T2-S
- ARM1156T2F-S
- ARM1176JZ-S
- ARM1176JZF
- ARM1176JZF-S
- Cortex-A5
- Cortex-A8
- Cortex-A9
- Cortex-M0
- Cortex-M1
- Cortex-M3
- Cortex-M4
- Cortex-R4
- Renesas RX

1.6 Built-in intelligence for supported CPU-cores

In general, there are two ways to support a CPU-core in the J-Link software:

- 1. Intelligence in the J-Link firmware
- 2. Intelligence on the PC-side (DLL)

Having the intelligence in the firmware is ideal since it is much more powerful and robust. The J-Link PC software automatically detects which implementation level is supported for the connected CPU-core. If intelligence in the firmware is available, it is used. If you are using a J-Link that does not have intelligence in the firmware and only PC-side intelligence is available for the connected CPU, a warning message is shown.

J-Link x.:	J-Link x.xx Warning 🛛 🔀							
⚠	You are using a J-Link which does not have intelligence for the selected CPU core (Cortex-M3) in the firmware.							
	Intelligence in the firmware enables J-Link to generate sequences for the CPU core. Without this feature, all sequences are generated by the PC.							
	Intelligence in the firmware allows higher target interface speeds and significantly enhances both speed and stability of the communication with the target CPU.							
	You can use this J-Link with your target CPU, but we recommend using a newer model of J-Link / J-Trace.							

1.6.1 Intelligence in the J-Link firmware

On newer J-Links, the intelligence for a new CPU-core is also available in the J-Link firmware which means that for these J-Links, the target sequences are no longer generated on the PC-side but directly inside the J-Link. Having the intelligence in the firmware leads to improved stability and higher performance.

1.6.2 Intelligence on the PC-side (DLL)

This is the basic implementation level for support of a CPU-core. This implementation is not J-Link model dependent, since no intelligence for the CPU-core is necessary in the J-Link firmware. This means, all target sequences (JTAG/SWD/...) are generated on the PC-side and the J-Link simply sends out these sequences and sends the result back to the DLL. Using this way of implementation also allows old J-Links to be used with new CPU cores as long as a DLL-Version is used which has intelligence for the CPU.

But there is one big disadvantage of implementing the CPU core support on the DLLside: For every sequence which shall be sent to the target a USB or Ethernet transaction is triggered. The long latency especially on a USB connection significantly affects the performance of J-Link. This is true especially when performing actions where J-Link has to wait for the CPU frequently. An example is a memory read/write operation which needs to be followed by status read operations or repeated until the memory operation is completed. Performing this kind of task with only PC-side intelligence requires to either make some assumption like: Operation is completed after a given number of cycles. Or it requires to make a lot of USB/Ethernet transactions. The first option (fast mode) will not work under some circumstances such as low CPU speeds, the second (slow mode) will be more reliable but very slow due to the high number of USB/Ethernet transactions. It simply boils down to: The best solution is having intelligence in the emulator itself!

1.6.2.1 Limitations of PC-side implementations

• Instability, especially on slow targets

Due to the fact that a lot of USB transactions would cause a very bad performance of J-Link, PC-side implementations are on the assumption that the CPU/ Debug interface is fast enough to handle the commands/requests without the need of waiting. So, when using the PC-side-intelligence, stability cannot be guaranteed in all cases, especially if the target interface speed (JTAG/SWD/...) is significantly higher than the CPU speed.

• Poor performance

Since a lot more data has to be transferred over the host interface (typically USB), the resulting download speed is typically much lower than for implementations with intelligence in the firmware, even if the number of transactions over the host interface is limited to a minimum (fast mode).

• No support

Please understand that we cannot give any support if you are running into problems when using a PC-side implementation.

Note: Due to these limitations, we recommend to use PC-side implementations for evaluation only.

1.6.3 Firmware intelligence per model

There are different models of J-Link / J-Trace which have built-in intelligence for different CPU-cores. In the following, we will give you an overview about which model of J-Link / J-Trace has intelligence for which CPU-core.

1.6.3.1 Current models

The table below lists the firmware CPU support for J-Link & J-Trace models currently available.

J-Link / J-Trace model		ARM 7/9	ARM 11	Cortex- A/R	Cort	ex-M	Renesas RX600
		JTAG	JTAG	JTAG	JTAG	SWD	JTAG
J-Link BASE	8					I	
J-Link PRO	3	S		Ø			I
J-link ULTRA	1	(S			
J-Link Lite ARM	8	v		Ø		I	⊗
J-Link Lite Cortex-M	8	⊗	×	\mathbf{x}			⊗
J-Link Lite RX	8	⊗	⊗	\mathbf{x}	╳	⊗	
J-Trace ARM	1	Ø	⊗	⊗	╳	×	⊗
J-Trace for Cortex-M	3	⊗	∞	\mathbf{x}			⊗

Table 1.16: Built-in intelligence of current J-Links

1.6.3.2 Older models

The table below lists the firmware CPU support for older J-Link & J-Trace models which are not sold anymore.

J-Link / J-Trace model		ARM 7/9	ARM 11	Cortex- A/R	Cor	tex-M	Renesas RX600
		JTAG	JTAG	JTAG	JTAG	SWD	JTAG
J-Link	3	⊗	⊗	⊗	8	not sup- ported	⊗
J-Link	4	⊗	⊗	\bigotimes	8	not sup- ported	\bigotimes
J-Link	5	(×	8	8	not sup- ported	\bigotimes
J-Link	6	(×	X	×	0	⊗
J-Link	7		×	\bigotimes	×	0	\bigotimes
J-Link Pro	1			0	♦	0	
J-Trace for Cortex-M	1	×	⊗	(•	0	\bigotimes

Table 1.17: Built-in intelligence of older J-Link models

1.7 Supported IDEs

J-Link / J-Trace can be used with different IDEs. Some IDEs support J-Link directly, for other ones additional software (such as J-Link RDI) is necessary in order to use J-Link. The following tables list which features of J-Link / J-Trace can be used with the different IDEs.

ARM7/9

IDE	Debug support ⁴	Flash download	Flash breakpoints	Trace support ³
IAR EWARM	yes	yes	yes	yes
Keil MDK	yes	yes	yes	no
Rowley	yes	yes	no	no
CodeSourcery	yes	no	no	no
Yargato (GDB)	yes	yes	yes	no
RDI compliant toolchains such as RVDS/ADS	yes ¹	yes ¹	yes ¹	no

ARM Cortex-M3

IDE	Debug support ⁴	Flash download	Flash breakpoints	Trace support ³	SWO support
IAR EWARM	yes	yes	yes	yes	yes
Keil MDK	yes	yes	yes	yes	yes
Rowley	yes	yes	no	no	no
CodeSourcery	yes	no	no	no	no
Yargato (GDB)	yes	yes	yes	no	no

ARM11

ARM11 has currently been tested with IAR EWARM only.

IDE	Debug support ⁴	Flash download	Flash breakpoints	Trace support ³
IAR EWARM	yes	no ²	no ²	no
Rowley	yes	no ²	no	no
Yargato (GDB)	yes	no ²	no ²	no

- ¹ Requires J-Link RDI license for download of more than 32KBytes
- ² Coming soon
- ³ Requires emulator with trace support
- ⁴ Debug support includes the following: Download to RAM, memory read/write, CPU register read/write, Run control (go, step, halt), software breakpoints in RAM and hardware breakpoints in flash memory.

Chapter 2 Licensing

This chapter describes the different license types of J-Link related software and the legal use of the J-Link software with original SEGGER and OEM products.

2.1 Components requiring a license

The following programs/features require a full-featured J-Link (PLUS, ULTRA+, PRO, J-Trace) or an additional license for the J-Link base model:

- J-Flash
- J-Link RDI
- J-Link Debugger
- Flash breakpoints (FlashBP)

2.2 License types

For each of the software components which require an additional license, there are different types of licenses which are explained in the following.

Built-in License

This type of license is easiest to use. The customer does not need to deal with a license key. The software automatically finds out that the connected J-Link contains the built-in license(s). The license is burned into the J-Link debug probe and can be used on any computer the J-Link is connected to. This type of license applies to the J-Link PLUS, J-Link ULTRA+ and J-Link Pro.

Key-based license

This type of license is used if you already have a J-Link, but order a license for a J-Link software component at a later time. In addition to that, the key-based license is used for trial licenses. To enable this type of license you need to obtain a license key from SEGGER. Free trial licenses are available upon request from *www.segger.com*. This license key has to be added to the J-Link license management. How to enter a license key is described in detail in *Licensing* on page 265. Every license can be used on different PCs, but only with the J-Link the license is for. This means that if you want to use flash breakpoints with other J-Links, every J-Link needs a license.

2.2.1 Built-in license

This type of license is easiest to use. The customer does not need to deal with a license key. The software automatically finds out that the connected J-Link contains the built-in license(s). To check what licenses the used J-Link have, simply open the J-Link commander (JLink.exe). The J-Link commander finds and lists all of the J-Link's licenses automatically, as can be seen in the screenshot below.

The J-Link PLUS in the example above contains licenses for all features. Note that GDB and FlashDL feature are no longer required.

2.2.2 Key-based license

When using a key-based license, a license key is required in order to enable the feature. License keys can be added via the J-Link License Manager. How to enter a license via the license manager is described in *Licensing* on page 265. Like the builtin license, the key-based license is only valid for one J-Link, so if another J-Link is used it needs a separate license.

2.3 Legal use of SEGGER J-Link software

The software consists of proprietary programs of SEGGER, protected under copyright and trade secret laws. All rights, title and interest in the software are and shall remain with SEGGER. For details, please refer to the license agreement which needs to be accepted when installing the software. The text of the license agreement is also available as entry in the start menu after installing the software.

Use of software

SEGGER J-Link software may only be used with original SEGGER products and authorized OEM products. The use of the licensed software to operate SEGGER product clones is prohibited and illegal.

2.3.1 Use of the software with 3rd party tools

For simplicity, some components of the J-Link software are also distributed by partners with software tools designed to use J-Link. These tools are primarily debugging tools, but also memory viewers, flash programming utilities as well as software for other purposes. Distribution of the software components is legal for our partners, but the same rules as described above apply for their usage: They may only be used with original SEGGER products and authorized OEM products. The use of the licensed software to operate SEGGER product clones is prohibited and illegal.

J-Link / J-Trace (UM08001)

2.4 Original SEGGER products

All of the follwing SEGGER products are supported by the OSs stated in Chapter 1.2 $_{\tt Supported\ OS}$

The following products are original SEGGER products for which the use of the J-Link software is allowed:

2.4.1 J-Link BASE

J-Link BASE is a JTAG emulator designed for ARM cores. It connects via USB or Ethernet to a PC running Microsoft Windows, Apple OSX or Linux. J-Link BASE has a built-in 20-pin JTAG connector, which is compatible with the standard 20-pin connector defined by ARM.

Included Licenses

J-Link Flashloaders J-Link GDB Server

Optional Licenses:

J-Link Debugger J-Flash Unlimited Flash Breakpoints RDI / RDDI

2.4.2 J-Link PLUS

J-Link PLUS is a USB powered JTAG emulator supporting a large number of CPU cores.

Based on a 32-bit RISC CPU, it can communicate at high speed with the supported target CPUs. J-Link is used around the world in tens of thousand places for development and production (flash programming) purposes.

J-Link is supported by all major IDEs such as IAR EWARM, Keil MDK, Rowley CrossWorks, Atollic TrueSTUDIO, IAR EWRX, Renesas HEW, Renesas e2studio, and many others.

Included Licenses

J-Link Flashloaders J-Link GDB Server J-Link Debugger J-Flash Unlimited Flash Breakpoints RDI / RDDI

2.4.3 J-link ULTRA+

J-link ULTRA+ is a JTAG/SWD emulator designed for ARM/Cortex and other supported CPUs. It is fully compatible to the standard J-Link and works with the same PC software. Based on the highly optimized and proven J-Link, it offers even higher speed as well as target power measurement capabilities due to the faster CPU, built-in FPGA and High speed USB interface. J-link ULTRA has a built-in 20-pin JTAG/SWD connector.

Included Licenses

J-Link Flashloaders J-Link GDB Server J-Link Debugger J-Flash Unlimited Flash Breakpoints RDI / RDDI

J-Link PRO

2.4.4

J-Link PRO is a JTAG emulator designed

for ARM cores. It connects via USB or Ethernet to a PC running Microsoft Windows, Apple OSX or Linux. J-Link has a built-in 20-pin JTAG connector, which is compatible with the standard 20-pin connector defined by ARM.

Included Licenses

J-Link Flashloaders J-Link GDB Server J-Link Debugger J-Flash Unlimited Flash Breakpoints RDI / RDDI

2.4.5J-Trace ARM

J-Trace ARM is a JTAG emulator designed for ARM cores which includes trace (ETM) support. It connects via USB to a PC running Microsoft Windows, Apple OSX or Linux. J-Trace has a built-in 20-pin JTAG connector and a built in 38-pin JTAG+Trace connector, which is compatible with the standard 20-pin connector and 38-pin connector defined by ARM.

Included Licenses

J-Link Flashloaders J-Link GDB Server J-Link Debugger J-Flash Unlimited Flash Breakpoints RDI / RDDI

2.4.6 J-Trace for Cortex-M

J-Trace for Cortex-M is a JTAG/SWD emulator designed for Cortex-M cores which include trace (ETM) support. J-Trace for Cortex-M can also be used as a regular J-Link.

Included Licenses

J-Link Flashloaders J-Link GDB Server J-Link Debugger J-Flash Unlimited Flash Breakpoints RDI / RDDI

Note: In order to use ETM trace on ARM7/9 targets, a J-Trace is needed.

2.4.7 Flasher ARM

Flasher ARM is a programming tool for microcontrollers with onchip or external Flash memory and ARM core. Flasher ARM is designed for programming flash targets with the J-Flash software or stand-alone. In addition to that Flasher ARM has all of the J-Link functionality. Flasher ARM connects via USB or via RS232 interface to a PC running Microsoft Windows 2000 or later. Flasher ARM has a built-in 20-pin JTAG connector, which is compatible with the standard 20-pin connector defined by ARM.

Licenses

Comes with built-in licenses for flash download and J-Flash.

2.4.8 Flasher RX

Flasher RX is a programming tool for Renesas RX600 series microcontrollers with on-chip or external flash memory and Renesas RX core. Flasher RX is designed for programming flash targets with the J-Flash software or stand-alone. In addition to that Flasher RX has all of the J-Link RX functionality. Flasher RX connects via Ethernet, USB or via RS232 interface to a PC running Microsoft Windows 2000 or later.

Flasher RX itself has a built-in 20-pin JTAG connector but is shipped with an 14-pin adapter for Renesas RX devices.

Licenses

Comes with built-in licenses for flash download and J-Flash.

2.4.9 Flasher PPC

Flasher PPC is a programming tool for PowerPC based microcontrollers with on-chip or external Flash memory. Flasher PPC is designed for programming flash targets with the J-Flash software or stand-alone. In addition to that Flasher PPC has all of the J-Link functionality. Flasher PPC connects via USB or via RS232 interface to a PC running Microsoft Windows 2000 or later. Flasher PPC has a built-in 20-pin JTAG connector, which is compatible with the standard 20-pin connector defined by ARM.

Licenses

Comes with built-in licenses for flash download and J-Flash.

2.5 J-Link OEM versions

There are several different OEM versions of J-Link on the market. The OEM versions look different, but use basically identical hardware. Some of these OEM versions are limited in speed, some can only be used with certain chips and some of these have certain add-on features enabled, which normally requires a license. In any case, it should be possible to use the J-Link software with these OEM versions. However, proper function cannot be guaranteed for OEM versions. SEGGER Microcontroller does not support OEM versions; support is provided by the respective OEM.

2.5.1 Analog Devices: mIDASLink

mIDASLink is an OEM version of J-Link, sold by Analog Devices.

Limitations

mIDASLink works with Analog Devices chips only. This limitation can NOT be lifted; if you would like to use J-Link with a device from an other manufacturer, you need to buy a separate J-Link.

Licenses

Licenses for RDI, J-Link FlashDL and FlashBP are included. Other licenses can be added.

2.5.2 Atmel: SAM-ICE

SAM-ICE is an OEM version of J-Link, sold by Atmel.

Limitations

SAM-ICE works with Atmel devices only. This limitation can NOT be lifted; if you would like to use J-Link with a device from an other manufacturer, you need to buy a separate J-Link.

Licenses

Licenses for RDI and GDB Server are included. Other licenses can be added.

2.5.3 Digi: JTAG Link

Digi JTAG Link is an OEM version of J-Link, sold by Digi International.

Limitations

Digi JTAG Link works with Digi devices only. This limitation can NOT be lifted; if you would like to use J-Link with a device from an other manufacturer, you need to buy a separate J-Link.

Licenses

License for GDB Server is included. Other licenses can be added.

2.5.4 IAR: J-Link / J-Link KS

IAR J-Link / IAR J-Link KS are OEM versions of J-Link, sold by IAR.

Limitations

IAR J-Link / IAR J-Link KS cannot be used with Keil MDK. This limitation can NOT be lifted; if you would like to use J-Link with Keil MDK, you need to buy a separate J-Link. IAR J-Link does not support kickstart power.

Licenses

No licenses are included. All licenses can be added.

2.5.5 IAR: J-Link Lite

IAR J-Link Lite is an OEM version of J-Link, sold by IAR.

Limitations

IAR J-Link Lite cannot be used with Keil MDK. This limitation can NOT be lifted; if you would like to use J-Link with Keil MDK, you need to buy a separate J-Link.

JTAG speed is limited to 4 MHz.

Licenses

No licenses are included. All licenses can be added.

Note: IAR J-Link is only delivered and supported as part of Starter-Kits. It is not sold to end customer directly and not guaranteed to work with custom hardware.

2.5.6 IAR: J-Trace

IAR J-Trace is an OEM version of J-Trace, sold by IAR.

Limitations

IAR J-Trace cannot be used with Keil MDK. This limitation can NOT be lifted; if you would like to use J-Trace with Keil MDK, you need to buy a separate J-Trace.

Licenses

No licenses are included. All licenses can be added.

2.5.7 NXP: J-Link Lite LPC Edition

J-Link Lite LPC Edition is an OEM version of J-Link, sold by NXP.

Limitations

J-Link Lite LPC Edition only works with NXP devices. This limitation can NOT be lifted; if you would like to use J-Link with a device from an other manufacturer, you need to buy a separate J-Link.

Licenses

No licenses are included.

2.5.8 SEGGER: J-Link Lite ARM

J-Link Lite ARM is a fully functional OEM-version of SEGGER J-Link. If you are selling evaluation-boards, J-Link Lite ARM is an inexpensive emulator solution for you. Your customer receives a widely acknowledged JTAG-emulator which allows to start right away with development.

Limitations

JTAG speed is limited to 4 MHz

Licenses

No licenses are included. All licenses can be added.

Note

J-Link Lite ARM is only delivered and supported as part of Starter Kits. It is not sold to end customers and not guaranteed to work with custom hardware.

78

2.6 J-Link OBs

J-Link OBs (J-Link On Board) are single chip versions of J-Link which are used on various evalboards. It is legal to use J-Link software with these boards.

2.7 Illegal Clones

Clones are copies of SEGGER products which use the copyrighted SEGGER Firmware without a license. It is strictly prohibited to use SEGGER J-Link software with illegal clones of SEGGER products. Manufacturing and selling these clones is an illegal act for various reasons, amongst them trademark, copyright and unfair business practise issues.

The use of illegal J-Link clones with this software is a violation of US, European and other international laws and is prohibited.

If you are in doubt if your unit may be legally used with SEGGER J-Link software, please get in touch with us.

End users may be liable for illegal use of J-Link software with clones.

Chapter 3

J-Link software and documentation package

This chapter describes the contents of the J-Link software and documentation package which can be downloaded from *www.segger.com*.

3.1 Software overview

The J-Link software and documentation package, which is available for download from *http://www.segger.com/jlink-software.html* includes some applications to be used with J-Link. It also comes with USB-drivers for J-Link and documentations in pdf format.

Software	Description
JLink Commander	Command-line tool with basic functionality for target analysis.
J-Link GDB Server	The J-Link GDB Server is a server connecting to the GNU Debugger (GDB) via TCP/IP. It is required for toolchains using the GDB protocol to connect to J-Link.
J-Link GDB Server command line ver- sion	Command line version of the J-Link GDB Server. Same func- tionality as the GUI version.
J-Link Remote Server	Utility which provides the possibility to use J-Link / J-Trace remotely via TCP/IP.
J-Mem Memory Viewer	Target memory viewer. Shows the memory content of a run- ning target and allows editing as well.
J-Flash ^a	Stand-alone flash programming application. For more informa- tion about J-Flash please refer to <i>J-Flash ARM User's Guide</i> (UM08003).
J-Link SWO Viewer	Free-of-charge utility for J-Link. Displays the terminal output of the target using the SWO pin. Can be used in parallel with a debugger or stand-alone.
J-Scope	J-Scope is a free-of-charge software to analyze and visualize data on a microcontroller in real-time, while the target is running.
J-Link SWO Ana- lyzer	Command line tool that analyzes SWO RAW output and stores it into a file.
JTAGLoad	Command line tool that opens an $_{\rm svf}$ file and sends the data in it via J-Link / J-Trace to the target.
J-Link Configurator	GUI-based configuration tool for J-Link. Allows configuration of USB identification as well as TCP/IP identification of J-Link. For more information about the J-Link Configurator, please refer to <i>J-Link Configurator</i> on page 167.
RDI support ^a	Provides Remote Debug Interface (RDI) support. This allows the user to use J-Link with any RDI-compliant debugger.
Processor specific tools	Free command-line tools for handling specific processors. Included are: STR9 Commander and STM32 Unlock.

Table 3.1: J-Link / J-Trace related software

a. Full-featured J-Link (PLUS, PRO, ULTRA+) or an additional license for J-Link base model required.

3.2 J-Link Commander (Command line tool)

J-Link Commander ($_{JLink.exe}$) is a tool that can be used for verifying proper installation of the USB driver and to verify the connection to the target CPU, as well as for simple analysis of the target system. It permits some simple commands, such as memory dump, halt, step, go etc. to verify the target connection.

3.2.1 Commands

The table below lists the available commands of J-Link Commander. All commands are listed in alphabetical order within their respective categories. Detailed descriptions of the commands can be found in the sections that follow.

Command (short form)	Explanation
B	asic
clrBP	Clear breakpoint.
clrWP	Clear watchpoint.
device	Selects a device.
erase	Erase internal flash of selected device.
exec	Execute command string.
exit (qc, q)	Closes J-Link Commander.
exitonerror (eoe)	Commander exits after error.
f	Prints firmware info.
go (g)	Starts the CPU core.
halt (h)	Halts the CPU core.
hwinfo	Show hardware info.
is	Scan chain select register length.
loadfile	Load data file into target memory.
log	Enables log to file.
mem	Read memory.
mem8	Read 8-bit items.
mem16	Read 16-bit items.
mem32	Read 32-bit items.
mem64	Read 64-bit items.
mr	Measures reaction time of RTCK pin.
ms	Measures length of scan chain.
power	Switch power supply for target.
r	Resets and halts the target.
readAP	Reads from a CoreSight AP register.
readDP	Reads from a CoreSight DP register.
regs	Shows all current register values.
rnh	Resets without halting the target.
rreg	Shows a specific register value.
rx	Reset target with delay.
savebin	Saves target memory into binary file.
setBP	Set breakpoint.
setPC	Set the PC to specified value.
setWP	Set watchpoint.
sleep	Waits the given time (in milliseconds).
speed	Set target interface speed.
st	Shows the current hardware status.
step (s)	Single step the target chip.
unlock	Unlocks a device.
verifybin	Compares memory with data file.
w1	Write 8-bit items.
w2	Write 16-bit items.
w4	Write 32-bit items.
writeAP	Writes to a CoreSight AP register.
writeDP	Writes to a CoreSight DP register.
wreg	Write register.

Command (short form)	Explanation		
Flasl	Flasher I/O		
fdelete (fdel)	Delete file on emulator.		
flist	List directory on emulator.		
fread (frd)	Read file from emulator.		
fshow	Read and display file from emulator.		
fsize (fsz)	Display size of file on emulator.		
fwrite (fwr)	Write file to emulator.		
Connection			
ip	Connect to J-Link Pro via TCP/IP.		
usb	Connect to J-Link via USB.		

3.2.1.1 clrBP

This command removes a breakpoint set by J-Link.

Syntax

clrBP <BP_Handle>

Parameter	Meaning
BP_Handle	Handle of breakpoint to be removed.

Example

clrBP 1

3.2.1.2 clrWP

This command removes a watchpoint set by J-Link.

Syntax

clrWP <WP_Handle>

Parameter	Meaning
WP_Handle	Handle of watchpoint to be removed.

Example

clrWP 0x2

3.2.1.3 device

Selects a specific device J-Link shall connect to and performs a reconnect. In most cases explicit selection of the device is not necessary. Selecting a device enables the user to make use of the J-Link flash programming functionality as well as using unlimited breakpoints in flash memory.

For some devices explicit device selection is mandatory in order to allow the DLL to perform special handling needed by the device.

Some commands require that a device is set prior to use them.

Syntax

device <DeviceName>

Parameter	Meaning
DeviceName	Valid device name: Device is selected. ?: Shows a device selection dialog.

Example

device stm32f407ig

3.2.1.4 erase

Erases all flash sectors of the current device. A device has to be specified previously.

Syntax

erase

3.2.1.5 exec

Execute command string. For more information about the usage of command strings please refer to *Command strings* on page 223.

Syntax

exec <Command>

Parameter	Meaning
Command	Command string to be executed.

Example

exec SupplyPower = 1

3.2.1.6 exit (qc, q)

This command closes the target connection, the connection to the J-Link and exits J-Link Commander.

Syntax

q

3.2.1.7 exitonerror (eoe)

This command toggles whether J-Link Commander exits on error or not.

Syntax

ExitOnError <1|0>\

Parameter	Meaning
	 J-Link Commander will now exit on Error. J-Link Commander will no longer exit on Error.

Example

eoe 1

3.2.1.8 f

Prints firmware and hardware version info. Please notice that minor hardware revisions may not be displayed, as they do not have any effect on the feature set.

Syntax

f

3.2.1.9 fdelete (fdel)

On emulators which support file I/O this command deletes a specific file.

Syntax

fdelete <FileName>]

Parameter	Meaning
FileName	File to delete from the Flasher.

Example

fdelete Flasher.dat

3.2.1.10 flist

On emulators which support file $\ensuremath{\mathrm{I/O}}$ this command shows the directory tree of the Flasher.

Syntax

flist

3.2.1.11 fread (frd)

On emulators which support file I/O this command reads a specific file. Offset applies to both destination and source file.

Syntax

```
fread <EmuFile> <HostFile> [<Offset> [<NumBytes>]]
```

Parameter	Meaning
EmuFile	File name to read from.
HostFile	Destination file on the host.
Offset	Specifies the offset in the file, at which data reading is started.
NumBytes	Maximum number of bytes to read.

Example

fread Flasher.dat C:\Project\Flasher.dat

3.2.1.12 fshow

On emulators which support file I/O this command reads and prints a specific file. Currently, only Flasher models support file I/O.

Syntax

fshow <FileName> [-a] [<Offset> [<NumBytes>]]

Parameter	Meaning
FileName	Source file name to read from the Flasher.
a	If set, Input will be parsed as text instead of being shown as hex.
Offset	Specifies the offset in the file, at which data reading is started.
NumBytes	Maximum number of bytes to read.

Example

fshow Flasher.dat

3.2.1.13 fsize (fsz)

On emulators which support file I/O this command gets the size of a specific file. Currently, only Flasher models support file I/O.

Syntax

fsize <FileName>]

Parameter	Meaning
FileName	Source file name to read from the Flasher.

Example

fsize Flasher.dat

3.2.1.14 fwrite (fwr)

On emulators which support file I/O this command writes a specific file. Currently, only Flasher models support file I/O.

NumBytes is limited to 512 bytes at once. This means, if you want to write e.g. 1024 bytes, you have to send the command twice, using an appropriate offset when send-ing it the second time. Offset applies to both destination and source file.

Syntax

fwrite <EmuFile> <HostFile> [<Offset> [<NumBytes>]]

Parameter	Meaning
EmuFile	File name to write to.
HostFile	Source file on the host
Offset	Specifies the offset in the file, at which data writing is started.
NumBytes	Maximum number of bytes to write.

Example

fwrite Flasher.dat C:\Project\Flasher.dat

3.2.1.15 go (g)

Starts the CPU. In order to avoid setting breakpoints it allows to define a maximum number of instructions which can be simulated/emulated. This is particulary useful when the program is located in flash and flash breakpoints are used. Simulating instructions avoids to reprogram the flash and speeds up (single) stepping.

Syntax

go [<NumSteps> [<Flags>]]

Parameter	Meaning
NumSteps	Maximum number of instructions allowed to be simulated. Instruc- tion simulation stops whenever a breakpointed instruction is hit, an instruction which cannot be simulated/emulated is hit or when Num- Steps is reached.
Flags	0: Do not start the CPU if a BP is in range of NumSteps 1: Overstep BPs

Example

```
go //Simply starts the CPU
```

go 20, 1

3.2.1.16 halt (h)

Halts the CPU Core. If successful, shows the current CPU registers.

Syntax

halt

3.2.1.17 hwinfo

This command can be used to get information about the power consumption of the target (if the target is powered via J-Link). It also gives the information if an overcurrent happened.

Syntax

hwinfo

3.2.1.18 ip

Closes any existing connection to J-Link and opens a new one via TCP/IP. If no IP Address is specified, the Emulator selection dialog shows up.

Syntax

ip [<Addr>]

Parameter	Meaning
Addr	Valid values: IP Address: Connects the J-Link with the specified IP-Address Host Name: Resolves the host name and connects to it. *: Invokes the Emulator selection dialog.

Example

ip 192.168.6.3

3.2.1.19 is

This command returns information about the length of the scan chain select register.

Syntax

is

3.2.1.20 loadfile

This command programs a given data file to a specified destination address. Currently supported data files are:

- *.mot
- *.srec
- *.s19
- *.s
- *.hex
- *.bin

Syntax

loadfile <Filename> [<Addr>]

Parameter	Meaning
Filename	Source filename
Addr	Destination address (Required for *.bin files)

Example

loadfile C:\Work\test.bin 0x2000000

3.2.1.21 log

Set path to logfile allowing the DLL to output logging information. If the logfile already exist, the contents of the current logfile will be overwritten.

Syntax

log <Filename>

Parameter	Meaning
Filename	Log filename

Example

log C:\Work\log.txt

3.2.1.22 mem

The command reads memory from the target system. If necessary, the target CPU is halted in order to read memory.

Syntax

mem [<Zone>:]<Addr>, <NumBytes> (hex)

Parameter	Meaning
Zone	Name of memory zone to access.
Addr	Start address.
Numbytes	Number of bytes to read. Maximum is 0x100000.

Example

mem 0, 100

3.2.1.23 mem8

The command reads memory from the target system in units of bytes. If necessary, the target CPU is halted in order to read memory.

Syntax

mem8 [<Zone>:]<Addr>, <NumBytes> (hex)

Parameter	Meaning
Zone	Name of memory zone to access.
Addr	Start address.
NumBytes	Number of bytes to read. Maximum is 0x10000.

Example

mem8 0, 100

3.2.1.24 mem16

The command reads memory from the target system in units of 16-bits. If necessary, the target CPU is halted in order to read memory.

Syntax

mem16 [<Zone>:]<Addr>, <NumBytes> (hex)

Parameter	Meaning
Zone	Name of memory zone to access.
Addr	Start address.
NumBytes	Number of bytes to read. Maximum is 0x8000.

Example

mem16 0, 100

3.2.1.25 mem32

The command reads memory from the target system in units of 32-bits. If necessary, the target CPU is halted in order to read memory.

Syntax

```
mem32 [<Zone>:]<Addr>, <NumBytes> (hex)
```

Parameter	Meaning
Zone	Name of memory zone to access.
Addr	Start address.
NumBytes	Number of bytes to read. Maximum is 0x4000.

Example

mem32 0, 100

3.2.1.26 mem64

The command reads memory from the target system in units of 64-bits. If necessary, the target CPU is halted in order to read memory.

Syntax

mem64 [<Zone>:]<Addr>, <NumBytes> (hex)

Parameter	Meaning
Zone	Name of memory zone to access.
Addr	Start address.
NumBytes	Number of bytes to read. Maximum is 0x4000.

Example

mem64 0, 100

3.2.1.27 mr

Measure reaction time of RTCK pin.

Syntax

mr [<RepCount>]

Parameter	Meaning
RepCount	Number of times the test is repeated (Default: 1).

Example

mr 3

3.2.1.28 ms

Measures the number of bits in the specified scan chain.

Syntax

ms <ScanChain>

Parameter	Meaning
ScanChain	Scan chain to be measured.

Example

ms 1

3.2.1.29 power

This command sets the status of the power supply over pin 19 of the JTAG connector. The KS(Kickstart) versions of J-Link have the 5V supply over pin 19 activated by default. This feature is useful for some targets that can be powered over the JTAG connector.

Syntax

power <State> [perm]

Parameter	Meaning
State	Valid values: On, Off
perm	Sets the specified State value as default.

Example

f

3.2.1.30 r

Resets and halts the target.

Syntax

r

3.2.1.31 readAP

Reads from a CoreSight AP register.

This command performs a full-qualified read which means that it tries to read until the read has been accepted or too many WAIT responses have been received.

In case actual read data is returned on the next read request (this is the case for example with interface JTAG) this command performs the additional dummy read request automatically.

Syntax

ReadAP <RegIndex>

Parameter	Meaning
RegIndex	Index of AP register to read

Example

```
// Read AP[0], IDR (register 3, bank 15)
//
WriteDP 2, 0x000000F0 // Select AP[0] bank 15
ReadAP 3 // Read AP[0] IDR
```

3.2.1.32 readDP

Reads from a CoreSight DP register.

This command performs a full-qualified read which means that it tries to read until the read has been accepted or too many WAIT responses have been received.

In case actual read data is returned on the next read request (this is the case for example with interface JTAG) this command performs the additional dummy read request automatically.

Syntax

ReadDP <RegIndex>

Parameter	Meaning
RegIndex	Index of DP register to read

Example

```
//
// Read DP-CtrlStat
//
ReadDP 1
```

3.2.1.33 regs

Shows all current register values.

Syntax

regs

3.2.1.34 rnh

This command performs a reset but without halting the device.

Syntax

rnh

3.2.1.35 rreg

The function prints the value of the specified CPU register.

Syntax

rreg <RegIndex>

Parameter	Meaning
RegIndex	Register to read.

Example

rreg 15

3.2.1.36 rx

Resets and halts the target. It is possible to define a delay in milliseconds after reset. This function is useful for some target devices which already contain an application or a boot loader and therefore need some time before the core is stopped, for example to initialize hardware, the memory management unit (MMU) or the external bus interface.

Syntax

rx <DelayAfterReset>

Parameter	Meaning
DelayAfter-	Delay in ms.
Reset	

Example

rx 10

3.2.1.37 savebin

Saves target memory into binary file.

Syntax

savebin <Filename>, <Addr>, <NumBytes> (hex)

Parameter	Meaning
Filename	Destination file
Addr	Source address.
NumBytes	Number of bytes to read.

Example

savebin C:\Work\test.bin 0x0000000 0x100

3.2.1.38 setBP

This command sets a breakpoint of a specific type at a specified address. Which breakpoint modes are available depends on the CPU that is used.

Syntax

setBP <Addr> [[A/T]/[W/H]] [S/H]

Parameter	Meaning
Addr	Address to be breakpointed.
A/T	Only for ARM7/9/11 and Cortex-R4 devices: A: ARM mode T: THUMB mode
W/H	Only for MIPS devices: W: MIPS32 mode (Word) H: MIPS16 mode (Half-word)
S/H	S: Force software BP H: Force hardware BP

Example

setBP 0x8000036

3.2.1.39 setPC

Sets the PC to the specified value.

Syntax

setpc <Addr>

Parameter	Meaning
Addr	Address the PC should be set to.

Example

setpc 0x59C

3.2.1.40 setWP

This command inserts a new watchpoint that matches the specified parameters. The enable bit for the watchpoint as well as the data access bit of the watchpoint unit are set automatically by this command. Moreover the bits DBGEXT, CHAIN and the

RANGE bit (used to connect one watchpoint with the other one) are automatically masked out. In order to use these bits you have to set the watchpoint by writing the ICE registers directly.

Syntax

setWP <Addr> [<AccessType>] [<Size>] [<Data> [<DataMask> [<AddrMask>]]]

Parameter	Meaning
Addr	Address to be watchpointed.
Accesstype	Specifies the control data on which data event has been set: R: read access W: write access
Size	Valid values: S8 S16 S32 Specifies to monitor an n-bit access width at the selected address.
Data	Specifies the Data on which watchpoint has been set.
DataMask	Specifies data mask used for comparison. Bits set to 1 are masked out, so not taken into consideration during data comparison. Please note that for certain cores not all Bit-Mask combinations are sup- ported by the core-debug logic. On some cores only complete bytes can be masked out (e.g. PIC32) or similar.
AddrMask	Specifies the address mask used for comparison. Bits set to 1 are masked out, so not taken into consideration during address compar- ison. Please note that for certain cores not all Bit-Mask combina- tions are supported by the core-debug logic. On some cores only complete bytes can be masked out (e.g. PIC32) or similar.

Example

setWP 0x2000000 W S8 0xFF

3.2.1.41 sleep

Waits the given time (in milliseconds).

Syntax

sleep <Delay>

Parameter	Meaning
Delay	Amount of time to sleep in ms.

Example

sleep 200

3.2.1.42 speed

This command sets the speed for communication with the CPU core.

Syntax

speed <Freq>|auto|adaptive

Parameter	Meaning
Freq	Specifies the interface frequency in kHz.
auto	Selects auto detection of JTAG speed.
adaptive	Selects adaptive clocking as JTAG speed.

Example

speed 4000 speed auto

3.2.1.43 st

This command prints the current hardware status. Prints the current status of TCK, TDI, TDO, TMS, TRES, TRST and the interface speeds supported by the target. Also shows the Target Voltage.

Syntax

st

3.2.1.44 step (s)

Target needs to be halted before calling this command. Executes a single step on the target. The instruction is overstepped even if it is breakpointed. Prints out the disassembly of the instruction to be stepped.

Syntax

step

3.2.1.45 unlock

This command unlocks a device which has been accidentally locked by malfunction of user software.

Syntax

unlock <DeviceName>

Parameter	Meaning
DeviceName	Name of the device family to unlock. Supported Devices: LM3Sxxx Kinetis EFM32Gxxx

Example

unlock Kinetis

3.2.1.46 usb

Closes any existing connection to J-Link and opens a new one via USB. It is possible to select a specific J-Link by port number.

Syntax

usb [<Port>]

Parameter	Meaning	
Port	Valid values: 03	

Example

usb

3.2.1.47 verifybin

Verifies if the specified binary is already in the target memory at the specified address.

Syntax

verifybin <Filename>, <Addr>

Parameter	Meaning	
Filename	Sample bin.	
Addr	Start address of memory to verify.	

Example

verifybin C:\Work\test.bin 0x000000

3.2.1.48 w1

The command writes one single byte to the target system.

Syntax

w1 [<Zone>:]<Addr>, <Data> (hex)

Parameter	Meaning	
Zone	Name of memory zone to access.	
Addr	Start address.	
Data	8-bits of data to write.	

Example

w1 0x10, 0xFF

3.2.1.49 w2

The command writes a unit of 16-bits to the target system.

Syntax

w2 [<Zone>:]<Addr>, <Data> (hex)

Parameter	Meaning		
Zone	Name of memory zone to access.		
Addr	Start address.		
Data	16-bits of data to write.		

Example

w2 0x0, 0xFFFF

3.2.1.50 w4

The command writes a unit of 32-bits to the target system.

Syntax

w4 [<Zone>:]<Addr>, <Data> (hex)

Parameter	Meaning	
Zone	Name of memory zone to access.	
Addr	Start address.	
Data	32-bits of data to write.	

Example

w4 0x0, 0xAABBCCFF

3.2.1.51 writeAP

Writes to a CoreSight AP register.

This command performs a full-qualified write which means that it tries to write until the write has been accepted or too many WAIT responses have been received.

Syntax

WriteAP <RegIndex>, <Data32Hex>

Parameter	Meaning	
RegIndex	Index of AP register to write	
Data32Hex	Data to write	

Example

```
//
// Select AHB-AP and configure it
//
WriteDP 2, 0x00000000 // Select AP[0] (AHB-AP) bank 0
WriteAP 4, 0x23000010 // Auto-increment, Private access, Access size: word
```

3.2.1.52 writeDP

Writes to a CoreSight DP register. This command performs a full-qualified write which means that it tries to write until the write has been accepted or too many WAIT responses have been received.

Syntax

WriteDP <RegIndex>, <Data32Hex>

Parameter	Meaning	
RegIndex	Index of DP register to write	
Data32Hex	Data to write	

Example

```
// Write DP SELECT register: Select AP 0 bank 15
//
WriteDP 2, 0x000000F0
```

3.2.1.53 wreg

Writes into a register. The value is written into the register on CPU start.

Syntax

wreg <RegName>, <Data>

Parameter	Meaning	
RegName	Register to write to.	
Data	Data to write to the specified register.	

Example

wreg R14, 0xFF

3.2.2 Command line options

J-Link Commander can be started with different command line options for test and automation purposes. In the following, the command line options which are available for J-Link Commander are explained. All command line options are case insensitive.

Command	Explanation	
-AutoConnect	Automatically start the target connect sequence	
-CommanderScript	Passes a CommandFile to J-Link	
-CommandFile	Passes a CommandFile to J-Link	
-Device	Pre-selects the device J-Link Commander shall connect to	
-ExitOnError	Commander exits after error.	
-If	Pre-selects the target interface	
-IP	Selects IP as host interface	
-JLinkScriptFile	Passes a JLinkScriptFile to J-Link	
-JTAGConf	Sets IRPre and DRPre	
-RTTTelnetPort	Sets the RTT Telnetport	
-SelectEmuBySN	Connects to a J-Link with a specific S/N over USB	
-SettingsFile	Passes a SettingsFile to J-Link	
-Speed	Starts J-Link Commander with a given initial speed	

Table 3.2: Available command line options

3.2.2.1 -AutoConnect

This command can be used to let J-Link Commander automatically start the connect sequence for connecting to the target when entering interactive mode.

Syntax

-autoconnect <1|0>

Example

JLink.exe -autoconnect 1

3.2.2.2 -CommanderScript

Similar to -CommandFile

3.2.2.3 -CommandFile

Selects a command file and starts J-Link Commander in batch mode. The batch mode of J-Link Commander is similar to the execution of a batch file. The command file is parsed line by line and one command is executed at a time.

Syntax

```
-CommandFile <CommandFilePath>
```

Example

See Using command files on page 103

3.2.2.4 -Device

Pre-selects the device J-Link Commander shall connect to. For some devices, J-Link already needs to know the device at the time of connecting, since special handling is required for some of them. For a list of all supported device names, please refer to *http://www.segger.com/jlink_supported_devices.html.*

Syntax

-Device <DeviceName>

Example

JLink.exe -Device STM32F103ZE

3.2.2.5 -ExitOnError

Similar to the exitonerror (eoe) command.

3.2.2.6 -lf

Selects the target interface J-Link shall use to connect to the target. By default, J-Link Commander first tries to connect to the target using the target interface which is currently selected in the J-Link firmware. If connecting fails, J-Link Commander goes through all target interfaces supported by the connected J-Link and tries to connect to the device.

Syntax

-If <TargetInterface>

Example

JLink.exe -If SWD

Additional information

Currently, the following target interfaces are supported:

- JTAG
- SWD

3.2.2.7 -IP

Selects IP as host interface to connect to J-Link. Default host interface is USB.

Syntax

-IP <IPAddr>

Example

JLink.exe -IP 192.168.1.17

Additional information

To select from a list of all available emulators on Ethernet, please use * as <IPAddr>.

3.2.2.8 -JLinkScriptFile

Passes the path of a J-Link script file to the J-Link Commander. J-Link scriptfiles are mainly used to connect to targets which need a special connection sequence before communication with the core is possible. For more information about J-Link script files, please refer to *J-Link script files* on page 206.

Syntax

JLink.exe -JLinkScriptFile <File>

Example

JLink.exe -JLinkScriptFile "C:\My Projects\Default.JLinkScript"

3.2.2.9 -JTAGConf

Passes IRPre and DRPre in order to select a specific device in a JTAG-chain. "-1,-1" can be used to let J-Link select a device automatically.

Syntax

-JTAGConf <IRPre>, <DRPre>

Example

JLink.exe -JTAGConf 4,1 JLink.exe -JTAGConf -1,-1

3.2.2.10 -SelectEmuBySN

Connect to a J-Link with a specific serial number via USB. Useful if multiple J-Links are connected to the same PC and multiple instances of J-Link Commander shall run and each connects to another J-Link.

Syntax

-SelectEmuBySN <SerialNo>

Example

JLink.exe -SelectEmuBySN 580011111

3.2.2.11 -RTTTelnetPort

This command alters the RTT telnet port. Default is 19021.

Syntax

-RTTTelnetPort <Port>

Example

```
JLink.exe -RTTTelnetPort 9100
```

3.2.2.12 -SettingsFile

DescriptionSelect a J-Link settings file to be used for the target device. The settings fail can contain all configurable options of the Settings tab in J-Link Control panel.

Syntax

-SettingsFile <PathToFile>

Example

JLink.exe -SettingsFile "C:\Work\settings.txt"

3.2.2.13 -Speed

Starts J-Link Commander with a given initial speed. Available parameters are "adaptive", "auto" or a freely selectable integer value in kHz. It is recommended to use either a fixed speed or, if it is available on the target, adaptive speeds. Default interface speed is 100kHz.

Syntax

-Speed <Speed_kHz>

Example

JLink.exe -Speed 4000

3.2.3 Using command files

J-Link commander can also be used in batch mode which allows the user to use J-Link commander for batch processing and without user interaction. Please do not confuse command file with J-Link script files (please refer to *J-Link script files* on page 206 for more information about J-Link script files). When using J-Link commander in batch mode, the path to a command file is passed to it. The syntax in the command file is the same as when using regular commands in J-Link commander (one line per command). SEGGER recommends to always pass the device name via command line option due some devices need special handling on connect/reset in order to guarantee proper function.

Example

JLink.exe -device STM32F103ZE -CommanderScript C:\CommandFile.jlink

Contents of CommandFile.jlink:

si 1 speed 4000 r h loadbin C:\firmware.bin,0x08000000

3.3 J-Link GDB Server

The GNU Project Debugger (GDB) is a freely available and open source debugger. It can be used in command line mode, but is also integrated in many IDEs like emIDE or Eclipse.

J-Link GDB Server is a remote server for GDB making it possible for GDB to connect to and communicate with the target device via J-Link. GDB Server and GDB communicate via a TCP/IP connection, using the standard GDB remote protocol. GDB Server receives the GDB commands, does the J-Link communication and replies with the answer to GDB.

With J-Link GDB Server debugging in ROM and Flash of the target device is possible and the Unlimited Flash Breakpoints can be used.

It also comes with some functionality not directly implemented in the GDB. These can be accessed via monitor commands, sent directly via GDB, too.

0 Bytes downloaded 1 JTAG device			

The GNU Project Debugger (GDB) is a freely available debugger, distributed under the terms of the GPL. The latest Unix version of the GDB is freely available from the GNU committee under: *http://www.gnu.org/software/gdb/download/*

J-Link GDB Server is distributed free of charge.

3.3.1 J-Link GDB Server CL (Windows, Linux, Mac)

J-Link GDB Server CL is a commandline-only version of the GDB Server. The command line version is part of the Software and Documentation Package and also included in the Linux and MAC versions.

Except for the missing GUI, J-Link GDB Server CL is identical to the normal version. All sub-chapters apply to the command line version, too.

3.3.2 Debugging with J-Link GDB Server

With J-Link GDB Server programs can be debugged via GDB directly on the target device like a normal application. The application can be loaded into RAM or flash of the device.

Before starting GDB Server make sure a J-Link and the target device are connected.

3.3.2.1 Setting up GDB Server GUI version

The GUI version of GDB Server is part of the Windows J-Link Software Package (JLinkGDBServer.exe).

When starting GDB Server a configuration dialog pops up letting you select the needed configurations to connect to J-Link and the target.

SEGGER J-Link GDB Server V4.74 - Config		
Connection to J-Link © USB □ Serial No.		
O ICP/IP		
Target device		
STM32F417IG		
Little endian		
Target interface		
SWD		
Speed		
C Auto selection		
C Adaptive glocking		
Command line option		
-select USB -device STM32F417IG -if SWD -speed 4000		
OK Cancel		

All configurations can optionally be given in the command line options.

Note: To make sure the connection to the target device can be established corretly, the device, as well as the interface and interface speed have to be given on start of GDB Server, either via command line options or the configuration dialog. If the target device option (-device) is given, the configuration dialog will not pop up.

3.3.2.2 Setting up GDB Server CL version

The command line version of GDB Server is part of the J-Link Software Package for all supported platforms.

On Windows its name is JLinkGDBServerCL.exe, on Linux and Mac it is JLinkGDB-Server.

Starting GDB Server on Windows

To start GDB Server CL on Windows, open the 'Run' prompt (Windows-R) or a command terminal (cmd) and enter <PathToJLinkSoftware>\JLinkGDBServerCL.exe <CommandLineOptions>.

Starting GDB Server on Linux / Mac

To start GDB Server CL on Linux / Mac, open a terminal and call JLinkGDBServer <CommandLineOptions>

Command Line Options

When using GDB Server CL, at least the mandatory command line options have to be given. Additional command line options can be given to change the default behavior of GDB Server.

For more information about the available command line options, please refer to *Command line options* on page 125.

3.3.2.3 GDB Server user interface

The J-Link GDB Server's user interface shows information about the debugging process and the target and allows to configure some settings during execution.

🔜 SEGGER J-Link GDB Server V4.74		
<u>F</u> ile <u>H</u> elp		
GDB Waiting for connection J-Link Connected CPU STM32F417IG	Initial SWD speed 4000 kHz Current SWD speed 4000 kHz 3.30 V Little endian	
0 Bytes downloaded	1 JTAG device	

It shows following information:

- The IP address of host running debugger.
- Connection status of J-Link.
- Information about the target core.
- Measured target voltage.
- Bytes that have been downloaded.
- Status of target.
- Log output of the GDB Server (optional, if Show log window is checked).
- Initial and current target interface speed.
- Target endianess.

These configurations can be made from inside GDB Server:

- Localhost only: If checked only connections from 127.0.0.1 are accepted.
- Stay on top
- Show log window.
- Generate logfile: If checked, a log file with the GDB <-> GDB Server <-> J-Link communication will be created.
- Verify download: If checked, the memory on the target will be verified after download.
- Init regs on start: If checked, the register values of the target will be set to a reasonable value before on start of GDB Server.

3.3.2.4 Running GDB from different programs

We assume that you already have a solid knowledge of the software tools used for building your application (assembler, linker, C compiler) and especially the debugger and the debugger frontend of your choice. We do not answer questions about how to install and use the chosen toolchain. GDB is included in many IDEs and most commonly used in connection with the GCC compiler toolchain. This chapter shows how to configure some programs to use GDB and connect to GDB Server. For more information about any program using GDB, please refer to its user manual.

emIDE

emIDE is a full-featured, free and open source IDE for embedded development including support for debugging with J-Link.

To connect to GDB Server with emIDE, the GDB Server configurations need to be set in the project options at Project -> Properties... -> Debugger.

Select the target device you are using, the target connection, endianess and speed and enter the additional GDB start commands.

The typically required GDB commands are:

#Initially reset the target
monitor reset
#Load the application
load

Other commands to set up the target (e.g. Set PC to RAM, initialize external flashes) can be entered here, too.

emIDE will automatically start GDB Server on start of the debug session. If it does not, or an older version of GDB Server starts, in emIDE click on JLink -> Run the JLink-plugin configuration.

The screenshot below shows a debug session in IDE. For download and more information about emIDE, please refer to *http://emide.org*.

Console

GDB can be used stand-alone as a console application.

To connect GDB to GDB Server enter target remote localhost:2331 into the running GDB. Within GDB all GDB commands and the remote monitor commands are available. For more information about debugging with GDB refer to its online manual available at http://sourceware.org/gdb/current/onlinedocs/gdb/.

A typical startup of a debugging session can be like:

```
(gdb) file C:/temp/Blinky.elf
Reading symbols from C:/temp/Blinky.elf...done.
(gdb) target remote localhost:2331
Remote debugging using localhost:2331
0x00000000 in ?? ()
(qdb) monitor reset
Resetting target
(gdb) load

Start address 0x8000485, load size 2852
Transfer rate: 146 KB/sec, 570 bytes/write.
(gdb) break main
Breakpoint 1 at 0x800037a: file Src\main.c, line 38.
(gdb) continue
Continuing.
Breakpoint 1, main () at Src\main.c:38
38
             Cnt = 0;
(gdb)
```

Eclipse (CDT)

Eclipse is an open source platform-independent software framework, which has typically been used to develop integrated development environment (IDE). Therefore Eclipse can be used as C/C++ IDE, if you extend it with the CDT plug-in (*http:// www.eclipse.org/cdt/*).

CDT means "C/C++ Development Tooling" project and is designed to use the GDB as default debugger and works without any problems with the GDB Server.

Refer to *http://www.eclipse.org* for detailed information about Eclipse.

Note: We only support problems directly related to the GDB Server. Problems and questions related to your remaining toolchain have to be solved on your own.

3.3.3 Supported remote (monitor) commands

J-Link GDB Server comes with some functionalities which are not part of the standard GDB. These functions can be called either via a gdbinit file passed to GDB Server or via monitor commands passed directly to GDB, forwarding them to GDB Server.

To indicate to GDB to forward the command to GDB Server 'monitor' has to be prepended to the call. For example a reset can be triggered in the gdbinit file with "reset" or via GDB with "monitor reset".

Following remote commands are available:

Remote command	Explanation	
clrbp	Removes an instruction breakpoint.	
cp15	Reads or writes from/to cp15 register.	
device	Select the specified target device.	
DisableChecks	Do not check if an abort occurred after memory read (ARM7/9 only).	
EnableChecks	Check if an abort occurred after memory read (ARM7/9 only).	
flash breakpoints	Enables/Disables flash breakpoints.	
getargs	Get the arguments for the application.	
go	Starts the target CPU.	
halt	Halts the target CPU.	
jtagconf	Configures a JTAG scan chain with multiple devices on it.	
memU8	Reads or writes a byte from/to given address.	
memU16	Reads or writes a halfword from/to given address.	
memU32	Reads or writes a word from/to given address.	
reg	Reads or writes from/to given register.	
regs	Reads and displays all CPU registers.	
reset	Resets and halts the target CPU.	
semihosting breakOn- Error	Enable or disable halting the target on semihosting error.	
semihosting enable	Enables semihosting.	
semihosting IOClient	Set semihosting I/O to be handled via Telnet port or GDB.	
semihosting ARMSWI	Sets the SWI number used for semihosting in ARM mode.	
semihosting ThumbSWI	Sets the SWI number used for semihosting in thumb mode.	
setargs	Set the arguments for the application.	
setbp	Sets an instruction breakpoint at a given address.	
sleep	Sleeps for a given time period.	
speed	Sets the JTAG speed of J-Link / J-Trace.	
step	Performs one or more single instruction steps.	
SWO DisableTarget	Undo target configuration for SWO and disable it in J-Link.	
SWO EnableTarget	Configure target for SWO and enable it in J-Link.	
SWO GetMaxSpeed	Prints the maximum supported SWO speed for J-Link and Target CPU.	
SWO GetSpeedInfo	Prints the available SWO speed and its minimum divider.	
waithalt	Waits for target to halt code execution.	
wice	Writes to given IceBreaker register.	
Table 3 3: GDB remote comm		

Table 3.3: GDB remote commands

Following remote commands are deprecated and only available for backward compability:

Remote command	Explanation	
	Select the specified target device.	
device	Note: Use command line option -device instead.	
interface	Select the target interface.	
	Note: Use command line option -if instead.	
	Sets the JTAG speed of J-Link / J-Trace.	
speed	Note: For the initial connection speed, use command line option -speed instead.	

Table 3.4: GDB remote commands

Note: The remote commands are case-insensitive.

Note: Optional parameters are set into square brackets.

Note: The examples are described as follows:

Lines starting with '#' are comments and not used in GDB / GDB Server.

Lines starting with r > r are input commands from the GDB.

Lines starting with i < i is the output from GDB Server as printed in GDB.

3.3.3.1 clrbp

Syntax

```
ClrBP [<BPHandle>]
```

or

```
ci [<BPHandle>]
```

Description

Removes an instruction breakpoint, where <BPHandle> is the handle of breakpoint to be removed. If no handle is specified this command removes all pending breakpoints.

Example

```
> monitor clrbp 1
```

or

```
> monitor ci 1
```

3.3.3.2 cp15

Syntax

cp15 <CRn>, <CRm>, <op1>, <op2> [= <data>]

Description

Reads or writes from/to cp15 register. If <data> is specified, this command writes the data to the cp15 register. Otherwise this command reads from the cp15 register. For further information please refer to the ARM reference manual.

Example

```
#Read:
> monitor cp15 1, 2, 6, 7
< Reading CP15 register (1,2,6,7 = 0x0460B77D)
#Write:
> monitor cp15 1, 2, 6, 7 = 0xFFFFFFFF
```

3.3.3.3 device

Note: Deprecated. Use command line option -device instead.

Syntax

device <DeviceName>

Description

Selects the specified target device. This is necessary for the connection and some special handling of the device.

Note: The device should be selected via commandline option $\ensuremath{-}\ensuremath{d}\ensuremath{v}\ensuremath{i}\ensuremath{a}\ensuremath{o}\ensuremath{a}\ensuremath{o}\ensuremath{a}\ensuremath{o}\ensuremath{a}\ensuremath$

Example

```
> monitor device STM32F417IG
< Selecting device: STM32F417IG</pre>
```

3.3.3.4 DisableChecks

Syntax

DisableChecks

Description

Disables checking if a memory read caused an abort (ARM7/9 devices only). On some CPUs during the init sequence for enabling access to the internal memory (for example on the TMS470) some dummy reads of memory are required which will cause an abort as long as the access-init is not completed.

3.3.3.5 EnableChecks

Syntax

EnableChecks

Description

Enables checking if a memory read caused an abort (ARM7/9 devices only). On some CPUs during the init sequence for enabling access to the internal memory (for example on the TMS470) some dummy reads of memory are required which will cause an abort as long as the access-init is not completed. The default state is: Checks enabled.

3.3.3.6 flash breakpoints

Syntax

monitor flash breakpoints = <Value>

Description

This command enables/disables the Flash Breakpoints feature.

By default Flash Breapkoints are enabled and can be used for evaluation.

Example

```
#Disable Flash Breakpoints:
> monitor flash breakpoints = 0
< Flash breakpoints disabled
#Enable Flash Breakpoins:
> monitor flash breakpoints = 1
< Flash breakpoints enabled</pre>
```

3.3.3.7 getargs

Syntax

getargs

Description

Get the currently set argument list which will be given to the application when calling semihosting command SYS_GET_CMDLINE (0x15). The argument list is given as one string.

Example

```
#No arguments set via setargs:
> monitor getargs
< No arguments.
#Arguments set via setargs:
> monitor getargs
< Arguments: test 0 1 2 arg0=4</pre>
```

3.3.3.8 go

Syntax

go

Description

Starts the target CPU.

Example

> monitor go

3.3.3.9 halt

Syntax

halt

Description

Halts the target CPU.

Example

> monitor halt

3.3.3.10 interface

Note: Deprecated. Use command line option -if instead.

Syntax

interface <InterfaceIdentifier>

Description

Selects the target interface used by J-Link / J-Trace.

3.3.3.11 jtagconf

Syntax

jtagconf <IRPre> <DRPre>

Description

Configures a JTAG scan chain with multiple devices on it. <IRPre> is the sum of IRLens of all devices closer to TDI, where IRLen is the number of bits in the IR (Instruction Register) of one device. <DRPre> is the number of devices closer to TDI. For more detailed information of how to configure a scan chain with multiple devices please refer to See "Determining values for scan chain configuration" on page 183..

Note: To make sure the connection to the device can be established correctly, it is recommended to configure the JTAG scan chain via command line options at the start of GDB Server.

Example

Select the second device, where there is 1 device in front with IRLen 4 > monitor jtagconf 4 1

3.3.3.12 memU8

Syntax

MemU8 <address> [= <value>]

Description

Reads or writes a byte from/to a given address. If <value> is specified, this command writes the value to the given address. Otherwise this command reads from the given address.

Example

```
#Read:
> monitor memU8 0x50000000
< Reading from address 0x50000000 (Data = 0x04)
#Write:
> monitor memU8 0x50000000 = 0xFF
< Writing 0xFF @ address 0x50000000</pre>
```

3.3.3.13 memU16

Syntax

```
memU16 <address> [= <value>]
```

Description

Reads or writes a halfword from/to a given address. If <value> is specified, this command writes the value to the given address. Otherwise this command reads from the given address.

Example

```
#Read:
> monitor memU16 0x50000000
< Reading from address 0x50000000 (Data = 0x3004)
#Write:
> monitor memU16 0x50000000 = 0xFF00
< Writing 0xFF00 @ address 0x50000000</pre>
```

3.3.3.14 memU32

Syntax

```
MemU32 <address> [= <value>]
```

Description

Reads or writes a word from/to a given address. If <value> is specified, this command writes the value to the given address. Otherwise this command reads from the given address. This command is similar to the long command.

Example

```
#Read:
> monitor memU32 0x50000000
< Reading from address 0x50000000 (Data = 0x10023004)
#Write:
> monitor memU32 0x50000000 = 0x10023004
< Writing 0x10023004 @ address 0x50000000</pre>
```

3.3.3.15 reg

Syntax

```
reg <RegName> [= <value>]
```

or

```
reg <RegName> [= (<address>)]
```

Description

Reads or writes from/to given register. If <value> is specified, this command writes the value into the given register. If <address> is specified, this command writes the memory content at address <address> to register <RegName>. Otherwise this command reads the given register.

Example

```
#Write value to register:
> monitor reg pc = 0x00100230
< Writing register (PC = 0x00100230)
#Write value from address to register:
> monitor reg r0 = (0x00000040)
< Writing register (R0 = 0x14813004)
#Read register value:
> monitor reg PC
< Reading register (PC = 0x00100230)</pre>
```

3.3.3.16 regs

Syntax

regs

Description

Reads all CPU registers.

Example

```
> monitor regs
< PC = 00100230, CPSR = 20000013 (SVC mode, ARM)
R0 = 14813004, R1 = 00000001, R2 = 00000001, R3 = 000003B5
R4 = 00000000, R5 = 00000000, R6 = 00000000, R7 = 00000000
USR: R8 =00000000, R9 =00000000, R10=00000000, R11 =00000000, R12 =00000000
R13=00000000, R9 =00000000, R10=00000000, R11 =00000000, R12 =00000000
FIQ: R8 =00000000, R9 =00000000, R10=00000000, R11 =00000000, R12 =00000000
SVC: R13=00200000, R14=00000000, SPSR=00000010
SVC: R13=00200100, R14=00000000, SPSR=0000010
IRQ: R13=00200100, R14=0000000, SPSR=0000010
UND: R13=00200100, R14=0000000, SPSR=0000010
```

3.3.3.17 reset

Syntax

reset

Description

Resets and halts the target CPU. Make sure the device is selected prior to using this command to make use of the correct reset strategy.

Add. information

There are different reset strategies for different CPUs. Moreover, the reset strategies which are available differ from CPU core to CPU core. J-Link can perform various reset strategies and always selects the best fitting strategy for the selected device.

Example

> monitor reset
< Resetting target</pre>

3.3.3.18 semihosting breakOnError

Syntax

semihosting breakOnerror <Value>

Description

Enables or disables halting the target at the semihosting breakpoint / in SVC handler if an error occurred during a semihosting command, for example a bad file handle for SYS_WRITE. The GDB Server log window always shows a warning in these cases. breakOnError is disabled by default.

Example

```
#Enable breakOnError:
> monitor semihosting breakOnError 1
```

3.3.3.19 semihosting enable

Syntax

semihosting enable [<VectorAddr>]

Description

Enables semihosting with the specified vector address. If no vector address is specified, the SWI vector (at address 0x8) will be used. GDBServer will output semihosting terminal data from the target via a separate connection on port 2333. Some IDEs already establish a connection automatically on this port and show terminal data in a specific window in the IDE.

For IDEs which do not support semihosting terminal output directly, the easiest way to view semihosting output is to open a telnet connection to the GDBServer on port 2333. The connection on this port can be opened all the time as soon as GDBServer is started, even before this remote command is executed.

Example

> monitor semihosting enable

< Semihosting enabled (VectorAddr = 0x08)

3.3.3.20 semihosting IOClient

Syntax

semihosting IOClient <ClientMask>

Description

GDB itself can handle (file) I/O operations, too. With this command it is selected wheter to print output via TELNET port (2333), GDB, or both. <ClientMask> is

- 1 for TELNET Client (Standard port 2333) (Default)
- 2 for GDB Client
- or 3 for both (Input via GDB Client)

Example

```
#Select TELNET port as output source
> monitor semihosting ioclient 1
< Semihosting I/O set to TELNET Client
#Select GDB as output source
> monitor semihosting ioclient 2
< Semihosting I/O set to GDB Client
#Select TELNET port and GDB as output source
> monitor semihosting ioclient 3
< Semihosting I/O set to TELNET and GDB Client</pre>
```

3.3.3.21 semihosting ARMSWI

Syntax

semihosting ARMSWI <Value>

118

Description

Sets the SWI number used for semihosting in ARM mode. The default value for the ARMSWI is 0x123456.

Example

> monitor semihosting ARMSWI 0x123456
< Semihosting ARM SWI number set to 0x123456</pre>

3.3.3.22 semihosting ThumbSWI

Syntax

semihosting ThumbSWI <Value>

Description

Sets the SWI number used for semihosting in thumb mode. The default value for the ThumbSWI is $0x\mbox{AB}$

Example

> monitor semihosting ThumbSWI 0xAB

< Semihosting Thumb SWI number set to 0xAB

3.3.3.23 setargs

Syntax

setargs <ArgumentString>

Description

Set arguments for the application, where all arguments are in one <Argument-String> separated by whitespaces.

The argument string can be gotten by the application via semihosting command SYS_GET_CMDLINE (0x15).

Semihosting has to be enabled for getting the argumentstring (semihosting enable). "monitor setargs" can be used before enabling semihosting.

The maximum length for <ArgumentString> is 512 characters.

Example

```
> monitor setargs test 0 1 2 arg0=4
< Arguments: test 0 1 2 arg0=4</pre>
```

3.3.3.24 setbp

Syntax

```
setbp <Addr> [<Mask>]
```

Description

Sets an instruction breakpoint at the given address, where <Mask> can be 0x03 for ARM instruction breakpoints (Instruction width 4 Byte, mask out lower 2 bits) or 0x01 for THUMB instruction breakpoints (Instruction width 2 Byte, mask out lower bit). If no mask is given, an ARM instruction breakpoint will be set.

Example

```
#Set a breakpoint (implicit for ARM instructions)
> monitor setbp 0x00000000
```

#Set a breakpoint on a THUMB instruction
> monitor setbp 0x00000100 0x01

3.3.3.25 sleep

Syntax

sleep <Delay>

Description

Sleeps for a given time, where <Delay> is the time period in milliseconds to delay. While sleeping any communication is blocked until the command returns after the given period.

Example

> monitor sleep 1000
< Sleep 1000ms</pre>

3.3.3.26 speed

Note: Deprecated. For setting the initial connection speed, use command line option -speed instead.

Syntax

speed <kHz>|auto|adaptive

Description

Sets the JTAG speed of J-Link / J-Trace. Speed can be either fixed (in kHz), automatic recognition or adaptive. In general, Adaptive is recommended if the target has an RTCK signal which is connected to the corresponding RTCK pin of the device (S-cores only). For detailed information about the different modes, refer to *JTAG Speed* on page 184.

The speed has to be set after selecting the interface, to change it from its default value.

Example

```
> monitor speed auto
< Select auto target interface speed (8000 kHz)
> monitor speed 4000
< Target interface speed set to 4000 kHz
> monitor speed adaptive
```

```
< Select adaptive clocking instead of fixed JTAG speed
```

3.3.3.27 step

Syntax

```
step [<NumSteps>]
```

or

```
si [<NumSteps>]
```

Description

Performs one or more single instruction steps, where <NumSteps> is the number of instruction steps to perform. If <NumSteps> is not specified only one instruction step will be performed.

Example

```
> monitor step 3
```

3.3.3.28 SWO DisableTarget

Syntax

SWO DisableTarget <PortMask[0x01-0xFFFFFFF]>

Description

Disables the output of SWO data on the target (Undoes changes from SWO Enable-Target) and stops J-Link to capture it.

Example

#Disable captureing SWO from stimulus ports 0 and 1
> monitor SWO DisableTarget 3
< SWO disabled succesfully.</pre>

3.3.3.29 SWO EnableTarget

Syntax

```
SWO EnableTarget <CPUFreq[Hz]> <SWOFreq[Hz]> <PortMask[0x01-0xFFFFFFF]
<Mode[0]>
```

Description

Configures the target to be able to output SWO data and starts J-Link to capture it. CPU and SWO frequency can be 0 for auto-detection.

If CPUFreq is 0, J-Link will measure the current CPU speed.

If SWOFreq is 0, J-Link will use the highest available SWO speed for the selected / measured CPU speed.

Note: CPUFreq has to be the speed at which the target will be running when doing SWO.

If the speed is different from the current speed when issuing CPU speed auto-detection, getting SWO data might fail.

SWOFreq has to be a quotient of the CPU and SWO speeds and their prescalers. To get available speed, use SWO GetSpeedInfo.

PortMask can be a decimal or hexadecimal Value. Values starting with the Prefix "0x" are handled hexadecimal.

Example

```
#Configure SWO for stimulus port 0, measure CPU frequency and calculate SWO frequency
> monitor SWO EnableTarget 0 0 1 0
< SWO enabled succesfully.</pre>
```

#Configure SWO for stimulus ports 0-2, fixed SWO frequency and measure CPU frequency
> monitor SWO EnableTarget 0 1200000 5 0
< CVO enabled suggestively.</pre>

< SWO enabled succesfully.

```
#Configure SWO for stimulus ports 0-255, fixed CPU and SWO frequency
> monitor SWO EnableTarget 72000000 6000000 0xFF 0
< SWO enabled succesfully.</pre>
```

3.3.3.30 SWO GetMaxSpeed

Syntax

SWO GetMaxSpeed <CPUFrequency [Hz]>

Description

Prints the maximum SWO speed supported by and matching both, J-Link and the target CPU frequency.

Example

#Get SWO speed for 72MHz CPU speed

> monitor SWO GetMaxSpeed 72000000
< Maximum supported SWO speed is 6000000 Hz.</pre>

3.3.3.31 SWO GetSpeedInfo

Syntax

SWO GetSpeedInfo

Description

Prints the base frequency and the minimum divider of the connected J-Link. With this, the available SWO speeds for J-Link can be calculated and the matching one for the target CPU frequency can be selected.

Example

> monitor SWO GetSpeedInfo
< Base frequency: 60000000Hz, MinDiv: 8</pre>

Available SWO speeds for J-Link are: 7.5MHz, 6.66MHz, 6MHz, ...

3.3.3.32 waithalt

Syntax

waithalt <Timeout>

or

wh <Timeout>

Description

Waits for target to halt code execution, where <Timeout> is the maximum time period in milliseconds to wait.

Example

#Wait for halt with a timeout of 2 seconds > monitor waithalt 2000

3.3.3.33 wice

Syntax

wice <RegIndex> <value>

or

rmib <RegIndex> <value>

Description

Writes to given IceBreaker register, where <value> is the data to write.

Example

> monitor wice 0x0C 0x100

3.3.4 SEGGER-specific GDB protocol extensions

J-Link GDB Server implements some functionality which are not part of the standard GDB remote protocol in general query packets. These SEGGER-specific general query packets can be sent to GDB Server on the low-level of GDB, via maintanace commands, or with a custom client connected to GDB Server.

General query packets start with a 'q'. SEGGER-specific general queries are followed by the identifier 'Segger' plus the command group, the actual command and its parameters.

Following SEGGER-specific general query packets are available:

Query Packet	Explanation
qSeggerSTRACE:config	Configure STRACE for usage.
qSeggerSTRACE:start	Start STRACE.
qSeggerSTRACE:stop	Stop STRACE.
qSeggerSTRACE:read	Read STRACE data.

Table 3.5: General Queries

3.3.4.1 qSeggerSTRACE:config

Syntax

qSeggerSTRACE:config:<ConfigString>

Parameter

ConfigString: String containing the configuration data separating settings by ';'.

Description

Configures STRACE for usage. Configuration for example includes specification of the trace port width to be used for tracing (1-bit, 2-bit, 4-bit (default) Port-Width=%Var%.

Note: For more information please refer to *UM08002* (J-Link SDK user guide), chapter *STRACE*.

Response

<ReturnValue>

ReturnValue is a 4 Byte signed integer.

>= 0 O.K. < 0 Error.

Note: ReturnValue is hex-encoded. Return value 0 is "00000000", return value -1 is "FFFFFFFF".

3.3.4.2 qSeggerSTRACE:start

Syntax

qSeggerSTRACE:start

Description

Starts capturing of STRACE data.

Note: For more information please refer to *UM08002* (J-Link SDK user guide), chapter *STRACE*.

Response

<ReturnValue>

ReturnValue is a 4 Byte signed integer.

>= 0 0.K. < 0 Error.

Note: ReturnValue is hex-encoded. Return value 0 is "00000000", return value -1 is "FFFFFFFF".

3.3.4.3 qSeggerSTRACE:stop

Syntax

qSeggerSTRACE:stop

Description

Stops capturing of STRACE data.

Note: For more information please refer to *UM08002* (J-Link SDK user guide), chapter *STRACE*.

Response

<ReturnValue>

ReturnValue is a 4 Byte signed integer.

>= 0 0.K. < 0 Error.

Note: ReturnValue is hex-encoded. Return value 0 is "00000000", return value -1 is "FFFFFFF".

3.3.4.4 qSeggerSTRACE:read

Syntax

qSeggerSTRACE:read:<NumItems>

Parameter

NumItems: Maximum number of trace data (addresses) to be read. Hexadecimal.

Description

Read the last recently called instruction addresses. The addresses are returned LIFO, meaning the last recent address is returned first.

Note: For more information please refer to *UM08002* (J-Link SDK user guide), chapter *STRACE*.

Response

```
<ReturnValue>[<Item0><Item1>...]
```

ReturnValue is a 4 Byte signed integer.

>= 0 Number of items read.

< 0 Error.

ItemN is a 4 Byte unsigned integer.

0x00000000 - 0xFFFFFFF Address of the executed instruction

Note: ReturnValue and ItemN are hex-encoded. e.g. 3 Items read: 0x08000010, 0x08000014, 0x08000018 Response will be: 00000003080000100800001408000018

3.3.5 Command line options

There are several command line options available for the GDB Server which allow configuration of the GDB Server before any connection to a J-Link is attempted or any connection from a GDB client is accepted.

Note: Using GDB Server CL, device, interface, endian and speed are mandatory options to correctly connect to the target, and should be given before connection via GDB. Using GDB Server GUI the mandatory options can also be selected in the configuration dialog.

Command line option	Explanation	
-device	Select the connected target device.	
-endian	Select the device endianness.	
-if	Select the interface to connect to the target.	
-speed	Select the target communication speed.	

Table 3.6: Mandatory command line options

Note: Using multiple instances of GDB Server, setting custom values for port, SWOPort and TelnetPort is necessary.

Command line option	Explanation	
-port	Select the port to listen for GDB clients.	
-swoport	Select the port to listen for clients for SWO RAW output.	
-telnetport	Select the port to listen for clients for printf output.	

Table 3.7: Port selection command line options

The GDB Server GUI version uses persistent settings which are saved across different instances and sessions of GDB Server. These settings can be toggled via the checkboxes in the GUI.

Note: GDB Server CL always starts with the settings marked as default.

For GUI and CL, the settings can be changed with following command line options. For all persistent settings there is a pair of options to enable or disable the feature.

Explanation	
Initialize the CPU registers on start of GDB Server. (Default)	
Do not initialize CPU registers on start of GDB Server.	
Allow only localhost connections (Windows default)	
Allow connections from outside localhost (Linux default)	
Generate a GDB Server log file.	
Do not generate a GDB Server log file. (Default)	
Halt the target on start of GDB Server.	
Do not halt the target on start of GDB Server. (Default)	
Do not show log output.	
Show log output. (Default)	
Set the GDB Server GUI to be the topmost window.	
Do not be the topmost window. (Default)	
Set the time after which the target has to be connected.	
Set infinite timeout for target connection.	
Verify after downloading.	
Do not verify after downloading. (Default)	

Table 3.8: Persistent command line options

126

Following additional command line options are available. These options are temporary for each start of GDB Server.

Command line option	Explanation	
-jtagconf	Configures a JTAG scan chain with multiple devices on it.	
-log	Logs the GDB Server communication to a specific file.	
-singlerun	Starts GDB Server in single run mode.	
-scriptfile	Uses a J-Link scriptfile.	
-select	Selects the interface to connect to J-Link (USB/IP).	
-settingsfile	Selects the J-Link Settings File.	
-strict	Starts GDB Server in strict mode.	
-x	Executes a gdb file on first connection.	
-xc	Executes a gdb file on every connection.	
-cpu	Selects the CPU core. Deprecated, use -device instead.	

Table 3.9: General command line options

3.3.5.1 -cpu

Description

Pre-select the CPU core of the connected device, so the GDB Server already knows the register set, even before having established a connection to the CPU.

Note: Deprecated, please use -device instead. Anyhow, it does not hurt if this option is set, too.

Syntax

-CPU <CPUCore>

Example

jlinkgdbserver -CPU ARM7_9

Add. information

The following table lists all valid values for <CPUCore>:

<cpucore></cpucore>	Supported CPU cores	
CPU_FAMILY_ARM7_9	Pre-select ARM7 and ARM9 as CPU cores.	
CPU_FAMILY_CORTEX_A_R	Pre-select Cortex-A and Cortex-R as CPU cores.	
CPU_FAMILY_CORTEX_M	Pre-select Cortex-M as CPU core.	
CPU_FAMILY_RX600	Pre-select Renesas RX600 as CPU core.	

Table 3.10: GDB allowed values for CPUCore

3.3.5.2 -device

Description

Tells GDBServer to which device J-Link is connected before the connect sequence is actually performed. It is recommended to use the command line option to select the device instead of using the remote command since for some devices J-Link already needs to know the device at the time of connecting to it since some devices need special connect sequences (e.g. devices with TI ICEPick modules). In such cases, it is not possible to select the device via remote commands since they are configured after the GDB client already connected to GDBServer and requested the target registers which already requires a connection to the target.

Note: Using GDB Server CL this option is mandatory to correctly connect to the target, and should be given before connection via GDB.

Syntax

-device <DeviceName>

Example

jlinkgdbserver -device AT91SAM7SE256

Add. information

For a list of all valid values for <DeviceName>, please refer to *http://www.seg-ger.com/jlink_supported_devices.html*.

3.3.5.3 -endian

Description

Sets the endianess of the target where endianess can either be "little" or "big".

Note: Using GDB Server CL this option is mandatory to correctly connect to the target, and should be given before connection via GDB.

Syntax

-endian <endianess>

Example

jlinkgdbserver -endian little

3.3.5.4 -if

Description

Selects the target interface which is used by J-Link to connect to the device. The default value is JTAG.

Note: Using GDB Server CL this option is mandatory to correctly connect to the target, and should be given before connection via GDB.

Syntax

-if <Interface>

Example

jlinkgdbserver -if SWD

Add. information

Currently, the following values are accepted for <Interface>:

- JTAG
- SWD
- FINE
- 2-wire-JTAG-PIC32

3.3.5.5 -ir

Description

Initializes the CPU register with default values on startup.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via -noir or the GUI.

Example

jlinkgdbserver -ir

3.3.5.6 -jtagconf

Syntax

-jtagconf <IRPre>, <DRPre>

Description

Configures a JTAG scan chain with multiple devices on it. <IRPre> is the sum of IRLens of all devices closer to TDI, where IRLen is the number of bits in the IR (Instruction Register) of one device. <DRPre> is the number of devices closer to TDI. For more detailed information of how to configure a scan chain with multiple devices please refer to See "Determining values for scan chain configuration" on page 183..

Example

Select the second device, where there is 1 device in front with IRLen 4 jlinkgdbserver -jtagconf 4,1

3.3.5.7 -localhostonly

Description

Starts the GDB Server with the option to listen on localhost only (This means that only TCP/IP connections from localhost are accepted) or on any IP address. To allow remote debugging (connecting to GDBServer from another PC), deactivate this option.

If no parameter is given, it will be set to 1 (active).

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-LocalhostOnly <State>

Example

jlinkgdbserver -LocalhostOnly 0 //Listen on any IP address (Linux/MAC default)

jlinkgdbserver -LocalhostOnly 1 //Listen on localhost only (Windows default)

3.3.5.8 -log

Description

Starts the GDB Server with the option to write the output into a given log file. The file will be created if it does not exist. If it exists the previous content will be removed. Paths including spaces need to be set between quotes.

Syntax

-log <LogFilePath>

Example

jlinkgdbserver -log "C:\my path\to\file.log"

3.3.5.9 -logtofile

Description

Starts the GDB Server with the option to write the output into a log file.

If no file is given via $\mbox{-log},$ the log file will be created in the GDB Server application directory.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via -nologtofile or the GUI.

Syntax

```
-logtofile
```

Example

jlinkgdbserver -logtofile

jlinkgdbserver -logtofile -log "C:\my path\to\file.log"

3.3.5.10 -halt

Description

Halts the target after connecting to it on start of GDB Server.

For most IDEs this option is mandatory since they rely on the target to be halted after connecting to GDB Server.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via -nohalt or the GUI.

Syntax

-halt

Example

jlinkgdbserver -halt

3.3.5.11 -noir

Description

Do not initialize the CPU registers on startup.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via -ir or the GUI.

Syntax

-noir

3.3.5.12 -nolocalhostonly

Description

Starts GDB Server with the option to allow remote connections (from outside local-host).

Same as -localhostonly 0

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-nolocalhostonly

3.3.5.13 -nologtofile

Description

Starts the GDB Server with the option to not write the output into a log file.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via -nologtofile or the GUI.

Note: When this option is used after -log, no log file will be generated, when -log is used after this option, a log file will be generated and this setting will be overrid-den.

Syntax

-nologtofile

Example

```
jlinkgdbserver -nologtofile // Will not generate a log file
jlinkgdbserver -nologtofile -log "C:\pathto\file.log" // Will generate a log file
jlinkgdbserver -log "C:\pathto\file.log" -nologtofile // Will not generate a log file
```

3.3.5.14 -nohalt

Description

When connecting to the target after starting GDB Server, the target is not explicitly halted and the CPU registers will not be inited.

After closing all GDB connections the target is started again and continues running.

Some IDEs rely on the target to be halted after connect. In this case do not use - nohalt, but -halt.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via -halt or the GUI.

Syntax

-nohalt

Example

jlinkgdbserver -nohalt

3.3.5.15 -nosilent

Description

Starts the GDB Server in non-silent mode. All log window messages will be shown.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-nosilent

3.3.5.16 -nostayontop

Description

Starts the GDB Server in non-topmost mode. All windows can be placed above it.

Note: For the CL version this setting has no effect.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-nostayontop

3.3.5.17 -notimeout

Description

GDB Server automatically closes after a timout of 5 seconds when no target voltage can be measured or connection to target fails.

This command line option prevents GDB Server from closing, to allow connecting a target after starting GDB Server.

Note: The recommended order is to power the target, connect it to J-Link and then start GDB Server.

Syntax

-notimeout

3.3.5.18 -novd

Description

Do not explicitly verify downloaded data.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-vd

3.3.5.19 -port

Description

Starts GDB Server listening on a specified port. This option overrides the default listening port of the GDB Server. The default port is 2331.

Note: Using multiple instances of GDB Server, setting custom values for this option is necessary.

Syntax

-port <Port>

Example

jlinkgdbserver -port 2345

3.3.5.20 -scriptfile

Description

Passes the path of a J-Link script file to the GDB Server. This scriptfile is executed before the GDB Server starts the debugging / identifying communication with the target. J-Link scriptfiles are mainly used to connect to targets which need a special connection sequence before communication with the core is possible. For more information about J-Link script files, please refer to *J-Link script files* on page 206.

Syntax

-scriptfile <ScriptFilePath>

Example

-scriptfile "C:\My Projects\Default.JLinkScript"

3.3.5.21 -select

Description

Specifies the host interface to be used to connect to J-Link. Currently, USB and TCP/ IP are available.

Syntax

-select <Interface>=<SerialNo>/<IPAddr>

Example

```
jlinkgdbserver -select usb=580011111
jlinkgdbserver -select ip=192.168.1.10
```

Additional information

For backward compatibility, when USB is used as interface serial numbers from 0-3 are accepted as USB=0-3 to support the old method of connecting multiple J-Links to a PC. This method is no longer recommended to be used. Please use the "connect via emulator serial number" method instead.

3.3.5.22 -settingsfile

Description

Select a J-Link settings file to be used for the target device. The settings fail can contain all configurable options of the Settings tab in J-Link Control panel.

Syntax

-SettingsFile <PathToFile>

Example

jlinkgdbserver -SettingsFile "C:\Temp\GDB Server.jlink"

3.3.5.23 -silent

Description

Starts the GDB Server in silent mode. No log window messages will be shown.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-silent

3.3.5.24 -singlerun

Description

Starts GDB Server in single run mode. When active, GDB Server will close when all client connections are closed.

In normal run mode GDB Server will stay open and wait for new connections.

When started in single run mode GDB Server will close immediately when connecting to the target fails. Make sure it is powered and connected to J-Link before starting GDB Server.

Syntax

-s -singlerun

3.3.5.25 -speed

Description

Starts GDB Server with a given initial speed.

Available parameters are "adaptive", "auto" or a freely selectable integer value in kHz. It is recommended to use either a fixed speed or, if it is available on the target, adaptive speeds.

Note: Using GDB Server CL this option is mandatory to correctly connect to the target, and should be given before connection via GDB.

Syntax

-speed <Speed_kHz>

134

Example

jlinkgdbserver -speed 2000

3.3.5.26 -stayontop

Description

Starts the GDB Server in topmost mode. It will be placed above all non-topmost windows and maintains it position even when it is deactivated.

Note: For the CL version this setting has no effect.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-stayontop

3.3.5.27 -timeout

Description

Set the timeout after which the target connection has to be established. If no connection could be established GDB Server will close.

The default timeout is 5 seconds for the GUI version and 0 for the command line version.

Note: The recommended order is to power the target, connect it to J-Link and then start GDB Server.

Syntax

```
-timeout <Timeout[ms]>
```

Example

Allow target connection within 10 seconds.

```
jlinkgdbserver -timeout 10000
```

3.3.5.28 -strict

Description

Starts GDB Server in sctrict mode. When strict mode is active GDB Server checks the correctness of settings and exits in case of a failure.

Currently the device name is checked. If no device name is given or the device is unknown to the J-Link, GDB Server exits instead of selecting "Unspecified" as device or showing the device selection dialog.

Syntax

- strict

Example

Following executions of GDB Server (CL) will cause exit of GDB Server.

jlinkgdbserver -strict -device UnknownDeviceName

jlinkgdbservercl -strict

Following execution of GDB Server will show the device selction dialog under Windows or select "Unspecified" directly under Linux / OS X.

```
jlinkgdbserver -device UnknownDeviceName
```

3.3.5.29 -swoport

Description

Set up port on which GDB Server should listen for an incoming connection that reads the SWO data from GDB Server. Default port is 2332.

Note: Using multiple instances of GDB Server, setting custom values for this option is necessary.

Syntax

-SWOPort <Port>

Example

jlinkgdbserver -SWOPort 2553

3.3.5.30 -telnetport

Description

Set up port on which GDB Server should listen for an incoming connection that gets target's printf data (Semihosting and anylized SWO data). Default port is 2333.

Note: Using multiple instances of GDB Server, setting custom values for this option is necessary.

Syntax

-TelnetPort <Port>

Example

jlinkgdbserver -TelnetPort 2554

3.3.5.31 -vd

Description

Verifys the data after downloading it.

Note: For the GUI version, this setting is persistent for following uses of GDB Server until changed via command line option or the GUI.

Syntax

-vd

3.3.5.32 -x

Description

Starts the GDB Server with a gdbinit (configuration) file. In contrast to the -xc command line option the GDB Server runs the commands in the gdbinit file once only direct after the first connection of a client.

Syntax

-x <ConfigurationFilePath>

Example

jlinkgdbserver -x C:\MyProject\Sample.gdb

3.3.5.33 -xc

Description

Starts the GDB Server with a gdbinit (configuration) file. GDB Server executes the commands specified in the gdbinit file with every connection of a client / start of a debugging session.

Syntax

-xc <ConfigurationFilePath>

Example

jlinkgdbserver -xc C:\MyProject\Sample.gdb

3.3.6 Program termination

J-Link GDB Server is normally terminated by a close or Ctrl-C event. When the single run mode is active it will also close when an error occurred during start or after all connections to GDB Server are closed.

On termination GDB Server will close all connections and disconnect from the target device, letting it run.

3.3.6.1 Exit codes

J-Link GDB Server terminates with an exit code indicating an error by a non-zero exit code.

Exit code	Description	
0	No error. GDB Server closed normally.	
-1	Unknown error. Should not happen.	
-2	Failed to open listener port (Default: 2331)	
-3	Could not connect to target. No target voltage detected or connection failed.	
-4	Failed to accept a connection from GDB.	
-5	Failed to parse the command line options, wrong or missing command line parameter.	
-6	Unknown or no device name set.	
-7	Failed to connect to J-Link.	

The following table describes the defined exit codes of GDB Server.

Table 3.11: GDB Server exit codes

3.3.7 Semihosting

Semihosting can be used with J-Link GDBServer and GDB based debug environments but needs to be explicitly enabled. For more information, please refer to *Enabling semihosting in J-Link GDBServer* on page 443.

3.4 J-Link Remote Server

J-Link Remote Server allows using J-Link / J-Trace remotely via TCP/IP. This enables you to connect to and fully use a J-Link / J-Trace from another computer. Performance is just slightly (about 10%) lower than with direct USB connection.

🔜 SEGGER J-Lin	k Remote Server V4.50	5 X
SERVER		CLIENT
IPStat	Connected to 127.0.0.1	
Total	R W 21 5 21 5	
USBStat	Idle	
Status	Stay on top	About
Waiting for client on port 19020.		

The J-Link Remote Server also accepts commands which are passed to the J-Link Remote Server via the command line.

3.4.1 List of available commands

The table below lists the commands accepted by the J-Link Remote Server

Command	Description	
port	Selects the IP port on which the J-Link Remote Server is listening.	
SelectEmuBySN	Selects the J-Link to connect to by its Serial Number.	
Table 3 12: Available commands		

Table 3.12: Available commands

3.4.1.1 port

Syntax

-port <Portno.>

Example

To start the J-Link Remote Server listening on port 19021 the command should look as follows:

-port 19021

3.4.1.2 SelectEmuBySN

Syntax

-SelectEmuBySN <S/N>

Example

To select the emulator with Serial Number 268000000 the command should look as follows:

-SelectEmuBySN 268000000

3.4.2 Tunneling mode

The Remote server provides a tunneling mode which allows remote connection to a J-Link / J-Trace from any computer, even from outside the local network.

To give access to a J-Link neither a remote desktop or vpn connection nor changing some difficult firewall settings is necessary.

When started in tunneling mode the Remote server connects to the SEGGER tunnel server via port 19020 and registers with its serial number. To connect to the J-Link from the remote computer an also simple connection to tunnel:<SerialNo> can be established and the debugger is connected to the J-Link.

🔜 SEGGER J-Link Remote Server V4.56 🛛 💻 🍽			
SERVER		NT	
IPStat	Connected to 88.84.155.118		
Total	R W W 7 5 5 7 5 5	/R 16 16	
USBStat	Idle		
	Stay on top	it	
Status			
Connected to tu	unnel server.		

Example scenario

A device vendor is developing a new device which shall be supported by J-Link. Because there is only one prototype, a shipment to SEGGER is not possible.

Instead the vendor can connect the device via J-Link to a local computer and start the Remote server in tunneling mode. The serial number of the J-Link is then sent to a to an engineer at SEGGER.

The engineer at SEGGER can use J-Link Commander or a debugger to test and debug the new device without the need to have the device on the desk.

Start J-Link Remote Server in tunneling mode

Connect to the J-Link / J-Trace via J-Link commander

J-Link Commander can be used to verify a connection to the J-Link can be established as follows:

Start J-Link Commander

From within J-Link Commander enter

ip tunnel:<SerialNo>

If the connection was successful it should look like in this screenshot.

Troubleshooting

Problem	Solution
Remote server cannot connect to tunnel server.	 Make sure the Remote server is not blocked by any firewall. Make sure port 19020 is not blocked by any firewall. Contact network admin.
J-Link Commander cannot connect to tunnel server.	 Make sure Remote server is started correctly. Make sure the entered serial number is correct. Make sure port 19020 is not blocked by any firewall. Contact network admin.

Table 3.13:

To test whether a connection to the tunnel server can be established or not a network protocol analyzer like Wireshark can help.

The network transfer of a successful connection should look like:

Source	Destination	Protocol	Info
192.168.11.31	88.84.155.118	TCP	51439 > j-link [SYN] Seq=0 Win=81
88.84.155.118	192.168.11.31	TCP	j-link > 51439 [SYN, ACK] Seq=0 A
192.168.11.31	88.84.155.118	TCP	51439 > j-link [ACK] Seq=1 Ack=1
192.168.11.31	88.84.155.118	TCP	51439 > j-link [PSH, ACK] Seq=1 A
192.168.11.31	88.84.155.118	TCP	51439 > j-link [PSH, ACK] Seq=5 A
88.84.155.118	192.168.11.31	TCP	j-link > 51439 [ACK] Seq=1 Ack=5
88.84.155.118	192.168.11.31	TCP	j-link > 51439 [ACK] Seq=1 Ack=9
88.84.155.118	192.168.11.31	TCP	j-link > 51439 [PSH, ACK] Seq=1 A
192.168.11.31	88.84.155.118	TCP	51439 > j-link [PSH, ACK] Seq=9 A
192.168.11.31	88.84.155.118	TCP	51439 > j-link [PSH, ACK] Seq=13 /
88.84.155.118	192.168.11.31	TCP	j-link > 51439 [ACK] Seq=5 Ack=80

3.5 J-Mem Memory Viewer

J-Mem displays memory contents of target systems and allows modifications of RAM and SFRs (Special Function Registers) while the target is running. This makes it possible to look into the memory of a target system at run-time; RAM can be modified and SFRs can be written. You can choose between 8/16/32-bit size for read and write accesses. J-Mem works nicely when modifying SFRs, especially because it writes the SFR only after the complete value has been entered.

3.6 J-Flash

J-Flash is an application to program data images to the flash of a target device. With J-Flash the internal flash of all J-Link supported devices can be programmed, as well as common external flashes connected to the device. Beside flash programming all other flash operations like erase, blank check and flash content verification can be done.

J-Flash requires an additional license from SEGGER to enable programming. For license keys, as well as evaluation licenses got to *http://www.segger.com* or contact us directly.

3.7 J-Link SWO Viewer

Free-of-charge utility for J-Link. Displays the terminal output of the target using the SWO pin. The stimulus port(s) from which SWO data is received can be chosen by using the port checkboxes 0 to 31. Can be used in parallel with a debugger or standalone. This is especially useful when using debuggers which do not come with built-in support for SWO such as most GDB / GDB+Eclipse based debug environments.

3.7.0.1 J-Link SWO Viewer CL

Command line-only version of SWO Viewer. All commands available for J-Link SWO Viewer can be used with J-Link SWO Viewer Cl. Similar to the GUI Version, J-Link SWO Viewer Cl asks for a device name or CPU clock speed at startup to be able to calculate the correct SWO speed or to connect to a running J-Link GDB Server

Using the syntax given below(List of available command line options), you can directly start J-Link SWO Viewer Cl with parameters.

3.7.1 Usage

J-Link SWO Viewer is available via the start menu.

It asks for a device name or CPU clock speed at startup to be able to calculate the correct SWO speed or to connect to a running J-Link GDB Server.

SEGGER J-Link SWO Viewer V4.78j - Config					
Please enter the target CPU frequency or select a device for automatic CPU frequency detection.					
Device: STM32F103ZG	<u>S</u> elect				
CPU [requency [kHz]: 72016	<u>M</u> easure				
	<u>C</u> ancel				

When running in normal mode J-Link SWO Viewer automatically performs the necessary initialization to enable SWO output on the target, in GDB Server mode the initialization has to be done by the debugger.

3.7.2 List of available command line options

J-Link SWO Viewer can also be controlled from the command line if used in a automated test environment etc.

When passing all necessary information to the utility via command line, the configuration dialog at startup is suppressed. Minimum information needed by J-Link SWO Viewer is the device name (to enable CPU frequency auto detection) or the CPU clock speed.

The table below lists the commands accepted by the J-Link SWO Viewer.

Command	Description
cpufreq	Select the CPU frequency.
device	Select the target device.
itmmask	Selects a set of itm stimulus ports which should be used to listen to.
itmport	Selects a itm stimulus port which should be used to listen to.
outputfile	Print the output of SWO Viewer to the selected file.
settingsfile	Specify a J-Link settings file.
swofreq	Select the CPU frequency.

Table 3.14: Available command line options

3.7.2.1 cpufreq

Defines the speed in Hz the CPU is running at. If the CPU is for example running at 96 MHz, the command line should look as below.

Syntax

-cpufreq <CPUFreq>

Example

-cpufreq 96000000

3.7.2.2 device

Select the target device to enable the CPU frequency auto detection of the J-Link DLL. To select a ST STM32F207IG as target device, the command line should look as below.

For a list of all supported device names, please refer to <Ref>

Syntax

-device <DeviceID>

Example

-deivce STM32F207IG

3.7.2.3 itmmask

Defines a set of stimulusports from which SWO data is received and displayed by SWO Viewer.

If itmmask is given, itmport will be ignored.

Syntax

```
-itmmask <Mask>
```

Example

Listen on ports 0 and 2

-itmmask 0x5

3.7.2.4 itmport

Defines the stimulus port from which SWO data is received and displayed by the SWO Viewer. Default is stimulus port 0. The command line should look as below.

Syntax

-itmport <ITMPortIndex>

Example

-itmport 0

3.7.2.5 outputfile

Define a file to which the output of SWO Viewer is printed.

Syntax

```
-outputfile <PathToFile>
```

Example

-outputfile "C:\Temp\Output.log"

3.7.2.6 settingsfile

Select a J-Link settings file to use for the target device.

Syntax

```
-settingsfile <PathToFile>
```

Example

```
-settingsfile "C:\Temp\Settings.jlink"
```

3.7.2.7 swofreq

Define the SWO frequency that shall be used by J-Link SWO Viewer for sampling SWO data.

Usually not necessary to define since optimal SWO speed is calculated automatically based on the CPU frequency and the capabilities of the connected J-Link.

Syntax

-swofreq <SWOFreq>

Example

-swofreg 6000

3.7.3 Configure SWO output after device reset

In some situations it might happen that the target application is reset and it is desired to log the SWO output of the target after reset during the booting process. For such situations, the target application itself needs to initialize the CPU for SWO output, since the SWO Viewer is not restarted but continuously running.

Example code for enabling SWO out of the target application

```
(*(volatile unsigned int*)0xE0000E00) // ITM Enable
#define ITM_ENA
#define ITM_TPR (*(volatile unsigned int*)0xE0000E40) // Trace Privilege Register
                     (*(volatile unsigned int*)0xE0000E80) // ITM Trace Control Reg.
(*(volatile unsigned int*)0xE0000FB0) // ITM Lock Status Register
#define ITM_TCR
#define ITM_LSR
                     (*(volatile unsigned int*)0xE000EDF0) // Debug register
#define DHCSR
                      (*(volatile unsigned int*)0xE000EDFC) // Debug register
#define DEMCR
#define TPIU_ACPR (*(volatile unsigned int*)0xE0040010) // Async Clock
                                                                                                \
#define TPIU_SPPR (*(volatile unsigned int*)0xE00400F0) // Selected Pin Protocol \
#define DWT_CTRL (*(volatile unsigned int*)0xE0001000) // DWT Control Register
#define FFCR
                    (*(volatile unsigned int*)0xE0040304) // Formatter and flush
                                                                  // Control Register
U32 _ITMPort = 0; // The stimulus port from which SWO data is received and displayed.
U32 TargetDiv = 1;// Has to be calculated according to
// the CPU speed and the output baud rate
static void _EnableSWO() {
  U32 StimulusRegs;
  11
  // Enable access to SWO registers
  11
  DEMCR | = (1 << 24);
  ITM_LSR = 0xC5ACCE55;
  11
  // Initially disable ITM and stimulus port
  // To make sure that nothing is transferred via SWO

```

3.8 SWO Analyzer

SWO Analyzer (SWOAnalyzer.exe) is a tool that analyzes SWO output. Status and summary of the analysis are output to standard out, the details of the analysis are stored in a file.

Usage

SWOAnalyzer.exe <SWOfile>

This can be achieved by simply dragging the SWO output file created by the J-Link DLL onto the executable.

Creating an SWO output file

In order to create the SWO output file, which is th input file for the SWO Analyzer, the J-Link config file needs to be modified.

It should contain the following lines:

[SWO]

SWOLogFile="C:\TestSWO.dat"

3.9 JTAGLoad (Command line tool)

JTAGLoad is a tool that can be used to open and execute an svf (Serial vector format) file for JTAG boundary scan tests. The data in the file will be sent to the target via J-Link / J-Trace.

SVF is a standard format for boundary scan vectors to be used with different tools and targets. SVF files contain human-readable ASCII SVF statements consisting of an SVF command, the data to be sent, the expected response, a mask for the response or additional information.

JTAGLoad supports following SVF commands:

- ENDDR
- ENDIR
- FREQUENCY
- HDR
- HIR
- PIOMAP
- PIO
- RUNTEST
- SDR
- SIR
- STATE
- TDR
- TIR

A simple SVF file to read the JTAG ID of the target can look like following:

```
! Set JTAG frequency
FREQUENCY 12000000HZ;
! Configure scan chain
! For a single device in chain, header and trailer data on DR and IR are 0
! Set TAP to IDLE state
STATE IDLE;
! Configure end state of DR and IR after scan operations
ENDDR IDLE;
ENDIR IDLE;
! Start of test
! 32 bit scan on DR, In: 32 0 bits, Expected out: Device ID (0x0BA00477)
SDR 32 TDI (0) TDO (0BA00477) MASK (0FFFFFF);
! Set TAP to IDLE state
STATE IDLE;
! End of test
```

SVD files allow even more complex tasks, basically everything which is possible via JTAG and the devices in the scan chain, like configuring an FPGA or loading data into memory.

3.10 J-Link RDI (Remote Debug Interface)

The J-Link RDI software is a remote debug interface for J-Link. It makes it possible to use J-Link with any RDI compliant debugger. The main part of the software is an RDI-compliant DLL, which needs to be selected in the debugger. There are two additional features available which build on the RDI software foundation. Each additional feature requires an RDI license in addition to its own license. Evaluation licenses are available free of charge. For further information go to our website or contact us directly.

Note: The RDI software (as well as flash breakpoints and flash downloads) do not require a license if the target device is an LPC2xxx. In this case the software verifies that the target device is actually an LPC 2xxx and have a device-based license.

3.10.1 Flash download and flash breakpoints

Flash download and flash breakpoints are supported by J-Link RDI. For more information about flash download and flash breakpoints, please refer to *J-Link RDI User's Guide (UM08004)*, chapter *Flash download* and chapter *Breakpoints in flash memory*.

3.11 **Processor specific tools**

The J-Link software and documentation package includes some tools which support processor specific functionalities, like unlocking a device.

3.11.1 J-Link STR91x Commander (Command line tool)

J-Link STR91x Commander (JLinkSTR91x.exe) is a tool that can be used to configure STR91x cores. It permits some STR9 specific commands like:

- Set the configuration register to boot from bank 0 or 1.
- Erase flash sectors.
- Read and write the OTP sector of the flash.
- Write-protect single flash sectors by setting the sector protection bits.
- Prevent flash from communicate via JTAG by setting the security bit.

All of the actions performed by the commands, excluding writing the OTP sector and erasing the flash, can be undone. This tool can be used to erase the flash of the controller even if a program is in flash which causes the CPU core to stall.

C:\Work\JLinl	kARM\Output\Debug\JLink5TR91x.exe
Available co	mmands are:
fsize	Set the size of the primary flash manually. Syntax: fsize 0!1!2!3, where 0 selects a 256 Kbytes device, 1 a 512 Kbytes device, 2 a 1024 KBytes device and 3 a 2048 Kbytes device
showconf mem	Show configuration register content and security status Read memory Syntax: mem (Addr>, <numbytes></numbytes>
erase	Erase flash sectors (OTP can not be erased). Syntax: erase (SectorMaskL), (SectorMaskH) SectorMaskL = Bits 0-8 mask sectors 0-8 of bank 0 SectorMaskH = Bits 0-4 mask sectors 0-4 of bank 1 Bit 17 masks the configuration sector Bit 18 masks the User-Code sector All other bits are ignored
	Erase flash bank Ø
erase bank1 erase all	Erase flash bank 1 Perform a full chip erase
setb	Boot from flash bank x <0 and 1 are available> Sytax: setb <int></int>
blank secure	Blank check all flash sectors Set the security bit. Protects device from read or debug access through the JTAG port (can only be cleared by a full chip erase).
unsecure	Unsecure the device. Content of configuration register is saved.
protect	Protect flash sectors. Syntax: protect (BankØSectorMask), (Bank1SectorMask) BankØSectorMask: Bits Ø-8 mask flash sectors Ø-8 of bank Ø Bank1SectorMask: Bits Ø-4 mask flash sectors Ø-4 of bank 1
unprotect	Unprotect flash sectors. Syntax: unprotect 〈BankØSectorMask〉, 〈Bank1SectorMask〉 BankØSectorMask: Bits Ø-8 mask flash sectors Ø-8 of bank Ø Bank1SectorMask: Bits Ø-4 mask flash sectors Ø-4 of bank 1
readotp writeotp	Read OTP sectors Write words to the OTP sectors. Suntax: writeotry (Word1), [(Word2),, {Word8)]
q	Quit
 J-Link>_	

When starting the STR91x commander, a command sequence will be performed which brings MCU into Turbo Mode.

"While enabling the Turbo Mode, a dedicated test mode signal is set and controls the GPIOs in output. The IOs are maintained in this state until a next JTAG instruction is sent." (ST Microelectronics)

Enabling Turbo Mode is necessary to guarantee proper function of all commands in the STR91x Commander.

3.11.1.1 Command line options

J-Link STR91x Commander can be started with different command line options. In the following, the command line options which are available for J-Link STR91x Commander are explained.

-CommandFile

Selects a command file and starts J-Link STR91x Commander in batch mode. The batch mode of J-Link Commander is similar to the execution of a batch file. The command file is parsed line by line and one command is executed at a time.

Syntax

-CommanderScript <CommandFilePath>

Example

See Using command files on page 103

-DRPre, -DRPost, -IRPre and -IRPost (Scan-Chain Configuration)

STR91x allows to configure a specific scan-chain via command-line. To use this feature four command line options have to be specified in order to allow a proper connection to the proper device. In case of passing an incomplete configuration, the utility tries to auto-detect.

Syntax

```
-DRPre <DRPre>
-DRPost <DRPost>
-IRPre <IRPre>
-IRPost <IRPost>
```

Example

JLink.exe -DRPre 1 -DRPost 4 -IRPre 16 -IRPost 20

-IP

Selects IP as host interface to connect to J-Link. Default host interface is USB.

Syntax

-IP <IPAddr>

Example

JLinkSTR91x.exe -IP 192.168.1.17

Additional information

To select from a list of all available emulators on Ethernet, please use * as <IPAddr>.

-SelectEmuBySN

Connect to a J-Link with a specific serial number via USB. Useful if multiple J-Links are connected to the same PC and multiple instances of J-Link STR91x Commander shall run and each connects to another J-Link.

Syntax

-SelectEmuBySN <SerialNo>

Example

JLinkSTR91x.exe -SelectEmuBySN 580011111

3.11.2 J-Link STM32 Unlock (Command line tool)

J-Link STM32 Unlock ($_{JLinkSTM32.exe}$) is a free command line tool which can be used to disable the hardware watchdog of STM32 devices which can be activated by programming the option bytes. Moreover the J-Link STM32 Commander unsecures a read-protected STM32 device by re-programming the option bytes.

Note: Unprotecting a secured device or will cause a mass erase of the flash memory.

3.11.2.1 Command Line Options

The J-Link STM32 Unlock Utility can be started with different command line options for test and automation purposes. In the following, the available command line options are explained.

-IP

Selects IP as host interface to connect to J-Link. Default host interface is USB.

Syntax

-IP <IPAddr>

Example

JLinkSTM32.exe -IP 192.168.1.17

Additional information

To select from a list of all available emulators on Ethernet, please use * as <IPAddr>.

-SelectEmuBySN

Connect to a J-Link with a specific serial number via USB. Useful if multiple J-Links are connected to the same PC.

Syntax

-SelectEmuBySN <SerialNo>

Example

JLinkSTM32.exe -SelectEmuBySN 580011111

-Speed

Starts J-Link STM32 Unlock Utility with a given initial speed. Available parameters are "adaptive", "auto" or a freely selectable integer value in kHz. It is recommended to use either a fixed speed or, if it is available on the target, adaptive speeds. Default interface speed is 1000 kHz.

Syntax

-Speed <Speed_kHz>

-SetPowerTarget

The connected debug probe will power the target via pin 19 of the debug connector.

Syntax

-SetPowerTarget <Mode>

Example

JLinkSTM32.exe -SetPowerTarget 1 // Target power will be set

-SetDeviceFamily

This command allows to specify a device family, so that no user input is required to start the unlocking process.

Syntax

-SetDeviceFamily <Parameter>

Parameter

There are two different options to specify the device family to be used:

a) Pass the list index from the list which shows all supported familys on start up

b) Pass the defined device name

ListIndex	Name
1	STM32F0xxxx
2	STM32F1xxxx
3	STM32F2xxxx
4	STM32F3xxxx
5	STM32F4xxxx
6	STM32L1xxxx

Table 3.15: Available Parameter for -SetDeviceFamily

Example

JLinkSTM32.exe	-SetDeviceFamily	6	//	Selects	STM32L1	series
JLinkSTM32.exe	-SetDeviceFamily	STM32L1xxxx	//	Selects	STM32L1	series

-Exit

In general, the J-Link STM32 utility waits at the end of the unlock process for any user input before application closes. This option allows to skip this step, so that the utility closes automatically.

Syntax

-Exit <Mode>

Example

JLinkSTM32.exe -Exit 1 // J-Link STM32 utility closes automatically

3.12 J-Link Software Developer Kit (SDK)

The J-Link Software Developer Kit is needed if you want to write your own program with J-Link / J-Trace. The J-Link DLL is a standard Windows DLL typically used from C programs (Visual Basic or Delphi projects are also possible). It makes the entire functionality of J-Link / J-Trace available through its exported functions, such as halt-ing/stepping the CPU core, reading/writing CPU and ICE registers and reading/writing memory. Therefore it can be used in any kind of application accessing a CPU core. The standard DLL does not have API functions for flash programming. However, the functionality offered can be used to program flash. In this case, a flash loader is required. The table below lists some of the included files and their respective purpose.

The J-Link SDK requires an additional license and is available upon request from *www.segger.com*.

Chapter 4 Setup

This chapter describes the setup procedure required in order to work with J-Link / J-Trace. Primarily this includes the installation of the J-Link software and documentation package, which also includes a kernel mode J-Link USB driver in your host system.

4.1 Installing the J-Link software and documentation pack

J-Link is shipped with a bundle of applications, corresponding manuals and some example projects and the kernel mode J-Link USB driver. Some of the applications require an additional license, free trial licenses are available upon request from *www.segger.com*.

Refer to chapter *J-Link software and documentation package* on page 81 for an overview of the J-Link software and documentation pack.

4.1.1 Setup procedure

To install the J-Link software and documentation pack, follow this procedure:

Note: We recommend to check if a newer version of the J-Link software and documentation pack is available for download before starting the installation. Check therefore the J-Link related download section of our website: http://www.seager.com/download jlink.html

 Before you plug your J-Link / J-Trace into your computer's USB port, extract the setup tool Setup_JLinkARM_V<VersionNumber>.zip. The setup wizard will install the software and documentation pack that also includes the certified J-Link USB driver. Start the setup by double clicking Setup_JLinkARM_V<Version-Number>.exe. The license Agreement dialog box will be opened. Accept the terms with the Yes button.

월 License Agreement	×
遇	Please read the following license agreement. Use the scroll bar to view the rest of this agreement.
	Important - Read carefully: This license is a legal agreement between YOU (either an individual or a single entity) and SEGGER Microcontroller Systeme GmbH (called SEGGER). By downloading and/or using J-Link ARM software, you agree to be bound by the terms of this agreement. 1. LICENSE AGREEMENT In this agreement "Licensor" shall mean SEGGER except under the following circumstances! If Licensee acquired the product as a bundled component of Co you accept all the terms of the preceding license agreement? If so, click on the Yes push button. If you select No, Setup will close
	Yes No

2. The **Welcome** dialog box is opened. Click **Next** > to open the **Choose Destina**tion Location dialog box.

3. Accept the default installation path C:\Program Files\SEG-GER\JLinkARM_V<VersionNumber> or choose an alternative location. Confirm your choice with the **Next >** button.

覺 Choose Destination Lo	ocation X
	Setup will install J-Link ARM V3.58c in the following folder.
	To install into a different folder, click Browse, and select another folder.
	You can choose not to install J-Link ARM V3.58c by clicking Cancel to exit Setup.
 3 3 4 	Destination Folder C:\\SEGGER\JLinkARM_V358c Browse
	< <u>B</u> ack Cancel

4. The **Choose options** dialog is opened.

The **Install J-Link Serial Port Driver** installs the driver for J-Links with CDC functionality. It is not preselected since J-Links without CDC functionality do not need this driver.

The **Create entry in start menu** creates an entry in start menu. It is preselected.

The **Add shortcuts to desktop** option can be selected in order to create a shortcut on the desktop.

Accept or deselect the options and confirm the selection with the **Next >** button.

覺 Choose options		×
	Choose options for creating shortcuts Create entry in start menu Image: Add shortcuts to desktop	
	< <u>B</u> ack	Cancel

5. The installation process will start.

Installing	
	Current File Copying file: C:\\LinkARM_V358c\USBDriver\JLinkx64.sys All Files Time Remaining 0 minutes 0 seconds
	< Back. Next > Cancel

6. The J-Link DLL Updater pops up, which allows you to update the DLL of an installed IDE to the DLL verion which is included in the installer. For further information about the J-Link DLL updater, please refer to *J-Link DLL updater* on page 171.

7. The **Installation Complete** dialog box appears after the copy process. Close the installation wizard with the **Finish** > button.

The J-Link software and documentation pack is successfully installed on your PC.

🚝 Installation Complete	×
Installation Complete	J-Link ARM V3.58c has been successfully installed. Press the Finish button to exit this installation.
***	< Beck. Enish > Cencel

8. Connect your J-Link via USB with your PC. The J-Link will be identified and after a short period the J-Link LED stops rapidly flashing and stays on permanently.

4.2 Setting up the USB interface

After installing the J-Link software and documentation package it should not be necessary to perform any additional setup sequences in order to configure the USB interface of J-Link.

4.2.1 Verifying correct driver installation

To verify the correct installation of the driver, disconnect and reconnect J-Link / J-Trace to the USB port. During the enumeration process which takes about 2 seconds, the LED on J-Link / J-Trace is flashing. After successful enumeration, the LED stays on permanently.

Start the provided sample application JLink.exe, which should display the compilation time of the J-Link firmware, the serial number, a target voltage of 0.000V, a complementary error message, which says that the supply voltage is too low if no target is connected to J-Link / J-Trace, and the speed selection. The screenshot below shows an example.

In addition you can verify the driver installation by consulting the Windows device manager. If the driver is installed and your J-Link / J-Trace is connected to your computer, the device manager should list the J-Link USB driver as a node below "Universal Serial Bus controllers" as shown in the following screenshot:

Right-click on the driver to open a context menu which contains the command **Properties**. If you select this command, a **J-Link driver Properties** dialog box is opened and should report: **This device is working properly**.

J-Link drive	r Properties	? ×

		OK Cancel		

4.2.2 Uninstalling the J-Link USB driver

If J-Link / J-Trace is not properly recognized by Windows and therefore does not enumerate, it makes sense to uninstall the J-Link USB driver.

This might be the case when:

- The LED on the J-Link / J-Trace is rapidly flashing.
- The J-Link / J-Trace is recognized as **Unknown Device** by Windows.

To have a clean system and help Windows to reinstall the J-Link driver, follow this procedure:

- 1. Disconnect J-Link / J-Trace from your PC.
- 2. Open the Add/Remove Programs dialog (Start > Settings > Control Panel > Add/Remove Programs) and select Windows Driver Package Segger

쪎 Add/Remove Programs - 🗆 × 17 Sort by: Name -Currently installed programs: Change o Remove 🔜 J-Link ARM V3.66a Windows Driver Package - Segger (jlink) USB (01/09/2007 2.6.5.0) 20 Click here for support information. 🔬 Add Ne To change this program or remove it from your computer, click Change/Remove. <u>⊂</u>hange/Remove S -

(jlink) USB and click the Change/Remove button.

3. Confirm the uninstallation process.

J-Link / J-Trace (UM08001)

4.3 Setting up the IP interface

Some emulators of the J-Link family have (or future members will have) an additional Ethernet interface, to communicate with the host system. These emulators will also come with a built-in web server which allows configuration of the emulator via web interface. In addition to that, you can set a default gateway for the emulator which allows using it even in large intranets. For simplicity the setup process of J-Link Pro (referred to as J-Link) is described in this section.

4.3.1 Configuring J-Link using J-Link Configurator

The J-Link software and documentation package comes with a free GUI-based utility called J-Link Configurator which auto-detects all J-Links that are connected to the host PC via USB & Ethernet. The J-Link Configurator allows the user to setup the IP interface of J-Link. For more information about how to use the J-Link Configurator, please refer to *J-Link Configurator* on page 167.

4.3.2 Configuring J-Link using the webinterface

All emulators of the J-Link family which come with an Ethernet interface also come with a built-in web server, which provides a web interface for configuration. This enables the user to configure J-Link without additional tools, just with a simple web browser. The **Home** page of the web interface shows the serial number, the current IP address and the MAC address of the J-Link.

SEGGER	J-Link Pro Webserver	SEGGER Microcontroller
Home Network information Network configuration System information Emulator status About	Home Emulator information: Firmware build: Dec 22 2008 09:24:26 Serial Number: Network information: Configuration type: User assigned IP Address: 192.168.90.11 /16 Gateway: 192.168.1.1	in in initial

The **Network configuration** page allows configuration of network related settings (IP address, subnet mask, default gateway) of J-Link. The user can choose between **automatic** IP assignment (settings are provided by a DHCP server in the network) and **manual** IP assignment by selecting the appropriate radio button.

SEGGER	J-Link Pro Webserver	SEGGER Microcontroller

4.4 FAQs

- Q: How can I use J-Link with GDB and Ethernet?
- A: You have to use the J-Link GDB Server in order to connect to J-Link via GDB and Ethernet.

4.5 J-Link Configurator

Normally, no configuration is required, especially when using J-Link via USB. For special cases like having multiple older J-Links connected to the same host PC in parallel, they need to be re-configured to be identified by their real serial number when enumerating on the host PC. This is the default identification method for current J-Links (J-Link with hardware version 8 or later). For re-configuration of old J-Links or for configuration of the IP settings (use DHCP, IP address, subnet mask, ...) of a J-Link supporting the Ethernet interface, SEGGER provides a GUI-based tool, called J-Link Configurator. The J-Link Configurator is part of the J-Link software and documentation package and can be used free of charge.

4.5.1 Configure J-Links using the J-Link Configurator

A J-Link can be easily configured by selecting the appropriate J-Link from the emulator list and using right click -> Configure.

4.6 J-Link USB identification

In general, when using USB, there are two ways in which a J-Link can be identified:

- By serial number
- By USB address

Default configuration of J-Link is: Identification by serial number. Identification via USB address is used for compatibility and not recommended.

Background information

"USB address" really means changing the USB-Product ID (PID).

The following table shows how J-Links enumerate in the different identification modes.

Identification	PID	Serial number	
Serial number (default)	0x0101	Serial number is real serial number of the J-Link or user assigned.	
USB address 0 (Deprecated)	0x0101	123456	
USB address 1 (Deprecated)	0x0102	123456	
USB address 2 (Deprecated)	0x0103	123456	
USB address 3 (Deprecated)	0x0104	123456	
Table 4.1, 1-1 ink enumeration in different identification modes			

Table 4.1: J-Link enumeration in different identification modes

4.6.1 Connecting to different J-Links connected to the same host PC via USB

In general, when having multiple J-Links connected to the same PC, the J-Link to connect to is explicitly selected by its serial number. Most software/debuggers provide an extra field to type-in the serial number of the J-Link to connect to.

The following screenshot shows the connection dialog of the J-Flash software:

The following screenshot shows the connection dialog of IAR EWARM:

ategory:			Factory Settings
eneral Options			
C/C++ Compiler			
Assembler	Setup Connection		
Output Converter	Setup Connection	Breakpoints	
Custom Build	Communication-		
Build Actions		Serial number 💌 Serial no: 5800xxx	×
inker	O ICP/IP:	IP address	
Debugger			
Simulator	IP address:	aaa.bbb.ccc.ddd Serial no:	
Angel			
GDB Server	Interface	JTAG scan chain	
IAR ROM-monitor		☐ JTAG scan chain with multiple targets	
J-Link/J-Trace	C	TAP number: 0	
TI Stellaris	○ <u>s</u> wd	☐ Scan chain contains non-ARM devi	ces
Macraigor PE micro		Preceeding bits: 0	
RDI		Preceeding bits: 0	
ST-LINK	Log <u>c</u> ommunic	ation	
Third-Party Driver			
TI XDS100	\$PROJ_DIR\$	cspycomm.log	
11 AD3100			

A debugger / software which does not provide such a functionality, the J-Link DLL automatically detects that multiple J-Links are connected to the PC and shows a selection dialog which allows the user to select the appropriate J-Link to connect to.

So even in IDEs which do not have an selection option for the J-Link, it is possible to connect to different J-Links.

4.7 Using the J-Link DLL

4.7.1 What is the JLink DLL?

The J-LinkARM.dll is a standard Windows DLL typically used from C or C++, but also Visual Basic or Delphi projects. It makes the entire functionality of the J-Link / J-Trace available through the exported functions.

The functionality includes things such as halting/stepping the ARM core, reading/ writing CPU and ICE registers and reading/writing memory. Therefore, it can be used in any kind of application accessing a CPU core.

4.7.2 Updating the DLL in third-party programs

The JLink DLL can be used by any debugger that is designed to work with it. Some debuggers are usually shipped with the J-Link DLL already installed. Anyhow it may make sense to replace the included DLL with the latest one available, to take advantage of improvements in the newer version.

4.7.2.1 Updating the J-Link DLL in the IAR Embedded Workbench for ARM (EWARM)

It is recommended to use the J-Link DLL updater to update the J-Link DLL in the IAR Embedded Workbench. The IAR Embedded Workbench IDE is a high-performance integrated development environment with an editor, compiler, linker, debugger. The compiler generates very efficient code and is widely used. It comes with the J-LinkARM.dll in the arm\bin subdirectory of the installation directory. To update this DLL, you should backup your original DLL and then replace it with the new one.

Typically, the DLL is located in C:\Program Files\IAR Systems\Embedded Workbench 6.n\arm\bin\.

After updating the DLL, it is recommended to verify that the new DLL is loaded as described in *Determining which DLL is used by a program* on page 172.

J-Link DLL updater

The J-Link DLL updater is a tool which comes with the J-Link software and allows the user to update the JLinkARM.dll in all installations of the IAR Embedded Workbench, in a simple way. The updater is automatically started after the installation of a J-Link software version and asks for updating old DLLs used by IAR. The J-Link DLL updater can also be started manually. Simply enable the checkbox left to the IAR installation which has been found. Click **Ok** in order to update the JLinkARM.dll used by the IAR installation.

In case of doubt, do not replace existing DLL(s). You can always perform this operation at a later time via start menu.					

4.7.3 Determining the version of JLink DLL

To determine which version of the JLinkARM.dll you are using, the DLL version can be viewed by right clicking the DLL in explorer and choosing Properties from the context menu. Click the Version tab to display information about the product version.

jlinkarm.dll Properties	×
General Version Security Summary	_,
File version: 3.0.4.0	
Description: SEGGER J-Link ARM interface DLL	
Copyright: Copyright © 2004, 2005

OK Cancel Apply	

4.7.4 Determining which DLL is used by a program

To verify that the program you are working with is using the DLL you expect it to use, you can investigate which DLLs are loaded by your program with tools like Sysinternals' Process Explorer. It shows you details about the DLLs used by your program, such as manufacturer and version.

Process Explorer is - at the time of writing - a free utility which can be downloaded from *www.sysinternals.com*.

4.8 Getting started with J-Link and ARM DS-5

J-Link supports ARM DS-5 Development via the RDDI protocol.

For commercially using J-Link via RDDI in ARM DS-5, an RDI/RDDI license is required. J-Link models which come with an RDI license, can also be used via RDDI. RDDI can be evaluated free of charge.

In order to use J-Link in ARM DS-5 Development Studio, the RDDI DLL in DS-5 needs to be replaced by the SEGGER version of this DLL. The SEGGER version of the RDDI still allows using ARM's DSTREAM in DS-5. After installing the J-Link software and documentation package, the J-Link DLL Updater is started which allows easily updating the RDDI DLL in DS-5. An backup of the original DLL is made automatically.

4.8.1 Replacing the RDDI DLL manually

If J-Link DLL Updater is unable to find a DS-5 installation and does not list it for updating, the RDDI DLL can always be replaced manually. For more information about how to manually update the RDDI DLL, please refer to $J_{JLINK_INST_DIR}\$

4.8.2 Using J-Link in DS-5 Development Studio

Please follow the following steps, in order to use J-Link in DS-5, after replacing the RDDI DLL accordingly:

- Connect J-Link and target.
- Open ARM DS-5.
- Open DS-5 Project for target.
- Open Debug Configurations...
- Select DS-5 Debugger on the left side.
- Press New button.
- In the Connection tab, select The target from the device database, **Bare Metal Debug**, **Debug via DSTREAM/RVI**.
- Click on the **Browse...** button right to the Text box at the bottom **Connection**.
- In the Dialog select the J-Link which is connected to the target (e.g. JLinkUSB:174200001).

Select Debug Hardware		
Туре	Name	Details
Unknown	J-LinkUSB:59200005	J-Link
Unknown	J-LinkUSB:174200001	J-Link PRO
Unknown	J-LinkIP:192.168.11.122	J-Link Pro
Unknown	J-LinkIP:192.168.6.4	J-Link ARM
Unknown	J-LinkIP:192.168.6.1	J-Link ARM
Unknown	J-LinkIP:192.168.6.2	J-Link ARM
?	ОК	Cancel

- Click ox.
- Add the device name to the connection string (e.g. JLinkUSB:174200001:Device

STM32F103ZG).

- Click Apply. ٠
- In the **Files** tab, select the application to download. ٠
- In the **Debugger** tab, select 'Debug from symbol' and enter main or select **Debug** • from entry point.
- Click Apply. •
- •
- Start a new debug session with the newly created debug configuration. Now the debug session should start and downloaded the application to the tar-٠ get.

Chapter 5 Working with J-Link and J-Trace

This chapter describes functionality and how to use J-Link and J-Trace.

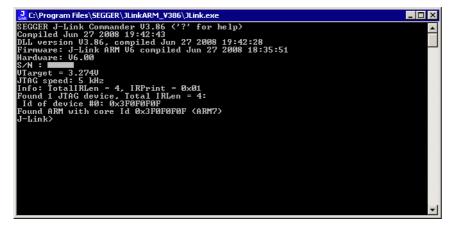

5.1 Connecting the target system

5.1.1 **Power-on sequence**

In general, J-Link / J-Trace should be powered on before connecting it with the target device. That means you should first connect J-Link / J-Trace with the host system via USB and then connect J-Link / J-Trace with the target device via JTAG. Power-on the device after you connected J-Link / J-Trace to it.

5.1.2 Verifying target device connection

If the USB driver is working properly and your J-Link / J-Trace is connected with the host system, you may connect J-Link / J-Trace to your target hardware. Then start JLink.exe which should now display the normal J-Link / J-Trace related information and in addition to that it should report that it found a JTAG target and the target's core ID. The screenshot below shows the output of JLink.exe. As can be seen, it reports a J-Link with one JTAG device connected.

5.1.3 Problems

If you experience problems with any of the steps described above, read the chapter *Support and FAQs* on page 445 for troubleshooting tips. If you still do not find appropriate help there and your J-Link / J-Trace is an original SEGGER product, you can contact SEGGER support via e-mail. Provide the necessary information about your target processor, board etc. and we will try to solve your problem. A checklist of the required information together with the contact information can be found in chapter *Support and FAQs* on page 445 as well.

5.2 Indicators

J-Link uses indicators (LEDs) to give the user some information about the current status of the connected J-Link. All J-Links feature the main indicator. Some newer J-Links such as the J-Link Pro / Ultra come with additional input/output Indicators. In the following, the meaning of these indicators will be explained.

5.2.1 Main indicator

For J-Links up to V7, the main indicator is single color (Green). J-Link V8 comes with a bi-color indicator (Green & Red LED), which can show multiple colors: green, red and orange.

5.2.1.1 Single color indicator (J-Link V7 and earlier)

Indicator status	Meaning
GREEN, flashing at 10 Hz	Emulator enumerates.
GREEN, flickering	Emulator is in operation. Whenever the emulator is exe- cuting a command, the LED is switched off temporarily. Flickering speed depends on target interface speed. At low interface speeds, operations typically take longer and the "OFF" periods are typically longer than at fast speeds.
GREEN, constant	Emulator has enumerated and is in idle mode.
GREEN, switched off for 10ms once per second	J-Link heart beat. Will be activated after the emulator has been in idle mode for at least 7 seconds.
GREEN, flashing at 1 Hz	Emulator has a fatal error. This should not normally happen.

Table 5.1: J-Link single color main indicator

5.2.1.2 Bi-color indicator (J-Link V8)

Indicator status	Meaning
GREEN, flashing at 10 Hz	Emulator enumerates.
GREEN, flickering	Emulator is in operation. Whenever the emulator is exe- cuting a command, the LED is switched off temporarily. Flickering speed depends on target interface speed. At low interface speeds, operations typically take longer and the "OFF" periods are typically longer than at fast speeds.
GREEN, constant	Emulator has enumerated and is in idle mode.
GREEN, switched off for 10ms once per second	J-Link heart beat. Will be activated after the emulator has been in idle mode for at least 7 seconds.
ORANGE	Reset is active on target.
RED, flashing at 1 Hz	Emulator has a fatal error. This should not normally happen.

Table 5.2: J-Link single color LED main color indicator

5.2.2 Input indicator

Some newer J-Links such as the J-Link Pro/Ultra come with additional input/output indicators. The input indicator is used to give the user some information about the status of the target hardware.

5.2.2.1 Bi-color input indicator

Indicator status	Meaning
GREEN	Target voltage could be measured. Target is connected.
ORANGE	Target voltage could be measured. RESET is pulled low (active) on target side.
RED	RESET is pulled low (active) on target side. If no target is connected, reset will also be active on target side.

Table 5.3: J-Link bi-color input indicator

5.2.3 Output indicator

Some newer J-Links such as the J-Link Pro/Ultra come with additional input/output indicators. The output indicator is used to give the user some information about the emulator-to-target connection.

5.2.3.1 Bi-color output indicator

Indicator status	Meaning
OFF	Target power supply via Pin 19 is not active.
GREEN	Target power supply via Pin 19 is active.
ORANGE	Target power supply via Pin 19 is active. Emulator pulls RESET low (active).
RED	Emulator pulls RESET low (active).

Table 5.4: J-Link bi-color output indicator

5.3 JTAG interface

By default, only one device is assumed to be in the JTAG scan chain. If you have multiple devices in the scan chain, you must properly configure it. To do so, you have to specify the exact position of the CPU that should be addressed. Configuration of the scan is done by the target application. A target application can be a debugger such as the IAR C-SPY® debugger, ARM's AXD using RDI, a flash programming application such as SEGGER's J-Flash, or any other application using J-Link / J-Trace. It is the application's responsibility to supply a way to configure the scan chain. Most applications offer a dialog box for this purpose.

5.3.1 Multiple devices in the scan chain

J-Link / J-Trace can handle multiple devices in the scan chain. This applies to hardware where multiple chips are connected to the same JTAG connector. As can be seen in the following figure, the TCK and TMS lines of all JTAG device are connected, while the TDI and TDO lines form a bus.

Currently, up to 8 devices in the scan chain are supported. One or more of these devices can be CPU cores; the other devices can be of any other type but need to comply with the JTAG standard.

5.3.1.1 Configuration

The configuration of the scan chain depends on the application used. Read *JTAG interface* on page 180 for further instructions and configuration examples.

5.3.2 Sample configuration dialog boxes

As explained before, it is the responsibility of the application to allow the user to configure the scan chain. This is typically done in a dialog box; some sample dialog boxes are shown below.

SEGGER J-Flash configuration dialog

This dialog box can be found at **Options|Project** settings.

	OK Cancel

5.3.3 Determining values for scan chain configuration

When do I need to configure the scan chain?

If only one device is connected to the scan chain, the default configuration can be used. In other cases, J-Link / J-Trace may succeed in automatically recognizing the devices on the scan chain, but whether this is possible depends on the devices present on the scan chain.

How do I configure the scan chain?

2 values need to be known:

- The position of the target device in the scan chain.
- The total number of bits in the instruction registers of the devices before the target device (IR len).

The position can usually be seen in the schematic; the IR len can be found in the manual supplied by the manufacturers of the others devices.

ARM7/ARM9 have an IR len of four.

Sample configurations

The diagram below shows a scan chain configuration sample with 2 devices connected to the JTAG port.

Examples

The following table shows a few sample configurations with 1,2 and 3 devices in different configurations.

Device 0 Chip(IR len)	Device 1 Chip(IR len)	Device 2 Chip(IR len)	Position	IR len
ARM(4)	-	-	0	0
ARM(4)	Xilinx(8)	-	0	0
Xilinx(8)	ARM(4)	-	1	8
Xilinx(8)	Xilinx(8)	ARM(4)	2	16

Table 5.5: Example scan chain configurations

Device 0 Chip(IR len)	Device 1 Chip(IR len)	Device 2 Chip(IR len)	Position	IR len
ARM(4)	Xilinx(8)	ARM(4)	0	0
ARM(4)	Xilinx(8)	ARM(4)	2	12
Xilinx(8)	ARM(4)	Xilinx(8)	1	8
	ARM(4)	、 <i>、 、 、</i>	1	8

 Table 5.5: Example scan chain configurations

The target device is marked in blue.

5.3.4 JTAG Speed

There are basically three types of speed settings:

- Fixed JTAG speed.
- Automatic JTAG speed.
- Adaptive clocking.

These are explained below.

5.3.4.1 Fixed JTAG speed

The target is clocked at a fixed clock speed. The maximum JTAG speed the target can handle depends on the target itself. In general CPU cores without JTAG synchronization logic (such as ARM7-TDMI) can handle JTAG speeds up to the CPU speed, ARM cores with JTAG synchronization logic (such as ARM7-TDMI-S, ARM946E-S, ARM966EJ-S) can handle JTAG speeds up to 1/6 of the CPU speed.

JTAG speeds of more than 10 MHz are not recommended.

5.3.4.2 Automatic JTAG speed

Selects the maximum JTAG speed handled by the TAP controller.

Note: On ARM cores without synchronization logic, this may not work reliably, because the CPU core may be clocked slower than the maximum JTAG speed.

5.3.4.3 Adaptive clocking

If the target provides the RTCK signal, select the adaptive clocking function to synchronize the clock to the processor clock outside the core. This ensures there are no synchronization problems over the JTAG interface.

If you use the adaptive clocking feature, transmission delays, gate delays, and synchronization requirements result in a lower maximum clock frequency than with nonadaptive clocking.

5.4 SWD interface

The J-Link support ARMs Serial Wire Debug (SWD). SWD replaces the 5-pin JTAG port with a clock (SWDCLK) and a single bi-directional data pin (SWDIO), providing all the normal JTAG debug and test functionality. SWDIO and SWCLK are overlaid on the TMS and TCK pins. In order to communicate with a SWD device, J-Link sends out data on SWDIO, synchronous to the SWCLK. With every rising edge of SWCLK, one bit of data is transmitted or received on the SWDIO.

5.4.1 SWD speed

Currently only fixed SWD speed is supported by J-Link. The target is clocked at a fixed clock speed. The SWD speed which is used for target communication should not exceed **target CPU speed * 10**. The maximum SWD speed which is supported by J-Link depends on the hardware version and model of J-Link. For more information about the maximum SWD speed for each J-Link / J-Trace model, please refer to *J-Link / J-Trace models* on page 28.

5.4.2 SWO

Serial Wire Output (SWO) support means support for a single pin output signal from the core. The Instrumentation Trace Macrocell (ITM) and Serial Wire Output (SWO) can be used to form a Serial Wire Viewer (SWV). The Serial Wire Viewer provides a low cost method of obtaining information from inside the MCU.

Usually it should not be necessary to configure the SWO speed because this is usually done by the debugger.

5.4.2.1 Max. SWO speeds

The supported SWO speeds depend on the connected emulator. They can be retrieved from the emulator. To get the supported SWO speeds for your emulator, use J-Link Commander:

J-Link> si 1 //Select target interface SWD J-Link> SWOSpeed

Currently, following speeds are supported:

Emulator	Speed formula	Resulting max. speed
J-Link V9	60MHz/n, n >= 8	7.5 MHz
J-Link Pro/ULTRA V4	3.2GHz/n, n >= 64	50 MHz

Table 5.6: J-Link supported SWO input speeds

5.4.2.2 Configuring SWO speeds

The max. SWO speed in practice is the max. speed which both, target and J-Link can handle. J-Link can handle the frequencies described in *SWO* on page 185 whereas the max. deviation between the target and the J-Link speed is about 3%.

The computation of possible SWO speeds is typically done in the debugger. The SWO output speed of the CPU is determined by TRACECLKIN, which is normally the same as the CPU clock.

Example1

Target CPU running at 72 MHz. n is be between 1 and 8192. Possible SWO output speeds are: 72MHz, 36MHz, 24MHz, ...

J-Link V9: Supported SWO input speeds are: $60MHz / n, n \ge 8$: 7.5MHz, 6.66MHz, 6MHz, ...

Permitted combinations are:

SWO output	SWO input	Deviation percent
6MHz, n = 12	6MHz, n = 10	0
4MHz, n = 18	4MHz, n = 15	0
		<= 3
2MHz, n = 36	2MHz, n = 30	0

Table 5.7: Permitted SWO speed combinations

Example 2

Target CPU running at 10 MHz.

Possible SWO output speeds are:

10MHz, 5MHz, 3.33MHz, ...

J-Link V7: Supported SWO input speeds are: 6MHz / n, n>= 1:

6MHz, 3MHz, 2MHz, 1.5MHz, ...

Permitted combinations are:

SWO output	SWO input	Deviation percent
2MHz, n = 5	2MHz, n = 3	0
1MHz, n = 10	1MHz, n = 6	0
769kHz, n = 13	750kHz, n = 8	2.53
	•••	•••

Table 5.8: Permitted SWO speed combinations

5.5 Multi-core debugging

J-Link / J-Trace is able to debug multiple cores on one target system connected to the same scan chain. Configuring and using this feature is described in this section.

5.5.1 How multi-core debugging works

Multi-core debugging requires multiple debuggers or multiple instances of the same debugger. Two or more debuggers can use the same J-Link / J-Trace simultaneously. Configuring a debugger to work with a core in a multi-core environment does not require special settings. All that is required is proper setup of the scan chain for each debugger. This enables J-Link / J-Trace to debug more than one core on a target at the same time.

The following figure shows a host, debugging two CPU cores with two instances of the same debugger.

Both debuggers share the same physical connection. The core to debug is selected through the JTAG-settings as described below.

5.5.2 Using multi-core debugging in detail

- 1. Connect your target to J-Link / J-Trace.
- 2. Start your debugger, for example IAR Embedded Workbench for ARM.
- 3. Choose Project Options and configure your scan chain. The picture below shows the configuration for the first CPU core on your target.

Options for node "BTL_	AT91_¥430"
Category: General Options C/C++ Compiler Assembler Custom Build Build Actions Linker Debugger Simulator Angel IAR ROM-monitor J-Link Macraigor RDI Third-Party Driver	Factory Settings Setup Connection Communication Image: Communication Image: USB Image: Communication Image: Image: Communication Image: Communication Image: Image: Communication Image: Communication Image: Communication Image: Communication Image: Communication Image: Communication Image: Communication Image: Communication Image: Communication Image: Communication
	OK Cancel

- 4. Start debugging the first core.
- 5. Start another debugger, for example another instance of IAR Embedded Workbench for ARM.

6. Choose Project | Options and configure your second scan chain. The following dialog box shows the configuration for the second ARM core on your target.

Options for node "BTL_ Category: General Options C/C++ Compiler Assembler Custom Build Build Actions Linker Debugger Simulator Angel IAR ROM-monitor J-Link Macraigor RDI Third-Party Driver	AT91_V430" Setup Connection Communication USB ICP/IP aaa.bbb.ccc.ddd JTAG scan chain JTAG scan chain JTAG scan chain with multiple targets TAP number: Scan chain contains non-ARM devices Preceeding bits: Log communication \$TOOLKIT_DIR\$\cspycomm.log	Factory Settings
	OK	Cancel

7. Start debugging your second core.

Example:

Core #1	Core #2	Core #3	TAP number debugger #1	TAP number debugger #2
ARM7TDMI	ARM7TDMI-S	ARM7TDMI	0	1
ARM7TDMI	ARM7TDMI	ARM7TDMI	0	2
ARM7TDM I-S	ARM7TDMI-S	ARM7TDMI-S	1	2

Table 5.9: Multicore debugging

Cores to debug are marked in blue.

5.5.3 Things you should be aware of

Multi-core debugging is more difficult than single-core debugging. You should be aware of the pitfalls related to JTAG speed and resetting the target.

5.5.3.1 JTAG speed

Each core has its own maximum JTAG speed. The maximum JTAG speed of all cores in the same chain is the minimum of the maximum JTAG speeds.

For example:

- Core #1: 2MHz maximum JTAG speed
- Core #2: 4MHz maximum JTAG speed
- Scan chain: 2MHz maximum JTAG speed

5.5.3.2 Resetting the target

All cores share the same RESET line. You should be aware that resetting one core through the RESET line means resetting all cores which have their RESET pins connected to the RESET line on the target.

5.6 Connecting multiple J-Links / J-Traces to your PC

In general, it is possible to have an unlimited number of J-Links / J-Traces connected to the same PC. Current J-Link models are already factory-configured to be used in a multi-J-Link environment, older J-Links can be re-configured to use them in a multi-J-link environment.

5.6.1 How does it work?

USB devices are identified by the OS by their product ID, vendor id and serial number. The serial number reported by current J-Links is a unique number which allows to have an almost unlimited number of J-Links connected to the same host at the same time. In order to connect to the correct J-Link, the user has to make sure that the correct J-Link is selected (by SN or IP). In cases where no specific J-Link is selected, following pop up will shop and allow the user to select the proper J-Link:

The sketch below shows a host, running two application programs. Each applicationcommunicates with one CPU core via a separate J-Link.

Older J-Links may report USB0-3 instead of unique serial number when enumerating via USB. For these J-Links, we recommend to re-configure them to use the new enumeration method (report real serial number) since the USB0-3 behavior is obsolete.

Re-configuration can be done by using the J-Link Configurator, which is part of the J-Link software and documentation package. For further information about the J-Link configurator and how to use it, please refer to *J-Link Configurator* on page 167.

Re-configuration to the old USB 0-3 enumeration method

In some special cases, it may be necessary to switch back to the obsolete USB 0-3 enumeration method. For example, old IAR EWARM versions supports connecting to a J-Link via the USB0-3 method only. As soon as more than one J-Link is connected to the pc, there is no oppertunity to pre-select the J-Link which should be used for a debug session.

Below, a small instruction of how to re-configure J-Link to enumerate with the old obsolete enumeration method in order to prevent compatibility problems, a short instruction is give on how to set USB enumeration method to USB 2 is given:

Config area byte	Meaning
	USB-Address. Can be set to 0-3, 0xFF is default which means USB-Address 0.
1	Enumeration method 0x00 / 0xFF: USB-Address is used for enumeration. 0x01: Real-SN is used for enumeration.

Table 5.10: Config area layout: USB-Enumeration settings

Example for setting enumeration method to USB 2:

1. Start J-Link Commander (JLink.exe) which is part of the J-Link software

- 2. Enter wconf 0 02 // Set USB-Address 2
- 3. Enter wconf 1 00 // Set enumeration method to USB-Address
- 4. Power-cycle J-Link in order to apply new configuration.

Re-configuration to REAL-SN enumeration can be done by using the J-Link Configurator, which is part of the J-Link software and documentation package. For further information about the J-Link configurator and how to use it, please refer to *J-Link Configurator* on page 167.

5.7 J-Link control panel

Since software version V3.86 J-Link the J-Link control panel window allows the user to monitor the J-Link status and the target status information in real-time. It also allows the user to configure the use of some J-Link features such as flash download, flash breakpoints and instruction set simulation. The J-Link control panel window can be accessed via the J-Link tray icon in the tray icon list. This icon is available when the debug session is started.

🚅 <mark>...</mark> 13:35

To open the status window, simply click on the tray icon.

5.7.1 Tabs

The J-Link status window supports different features which are grouped in tabs. The organization of each tab and the functionality which is behind these groups will be explained in this section

5.7.1.1 General

In the **General** section, general information about J-Link and the target hardware are shown. Moreover the following general settings can be configured:

- **Show tray icon**: If this checkbox is disabled the tray icon will not show from the next time the DLL is loaded.
- **Start minimized**: If this checkbox is disabled the J-Link status window will show up automatically each time the DLL is loaded.
- **Always on top**: if this checkbox is enabled the J-Link status window is always visible even if other windows will be opened.

The general information about target hardware and J-Link which are shown in this section, are:

- **Process**: Shows the path of the file which loaded the DLL.
- **J-Link**: Shows OEM of the connected J-Link, the hardware version and the Serial number. If no J-Link is connected it shows "not connected" and the color indicator is red.
- **Target interface**: Shows the selected target interface (JTAG/SWD) and the current JTAG speed. The target current is also shown. (Only visible if J-Link is connected)
- Endian: Shows the target endianess (Only visible if J-Link is connected)
- **Device**: Shows the selected device for the current debug session.
- License: Opens the J-Link license manager.
- **About**: Opens the about dialog.

5.7.1.2 Settings

In the **Settings** section project- and debug-specific settings can be set. It allows the configuration of the use of flash download and flash breakpoints and some other target specific settings which will be explained in this topic. Settings are saved in the configuration file. This configuration file needs to be set by the debugger. If the debugger does not set it, settings can not be saved. All settings which are modified during the debug session have to be saved by pressing **Save settings**, otherwise they are lost when the debug session is closed.

Section: Flash download

In this section, settings for the use of the J-Link <code>FlashDL</code> feature and related settings can be configured. When a license for J-Link <code>FlashDL</code> is found, the color indicator is green and "License found" appears right to the J-Link <code>FlashDL</code> usage settings.

- Auto: This is the default setting of J-Link FlashDL usage. If a license is found J-Link FlashDL is enabled. Otherwise J-Link FlashDL will be disabled internally.
- **On:** Enables the J-Link FlashDL feature. If no license has been found an error message appears.
- Off: Disables the J-Link FlashDL feature.
- Skip download on CRC match: J-Link checks the CRC of the flash content to determine if the current application has already been downloaded to the flash. If a CRC match occurs, the flash download is not necessary and skipped. (Only available if J-Link FlashDL usage is configured as Auto or On)
- Verify download: If this checkbox is enabled J-Link verifies the flash content after the download. (Only available if J-Link FlashDL usage is configured as Auto or On)

Section: Flash breakpoints:

In this section, settings for the use of the FlashBP feature and related settings can be configured. When a license for FlashBP is found, the color indicator is green and "License found" appears right to the FlashBP usage settings.

- Auto: This is the default setting of FlashBP usage. If a license has been found the FlashBP feature will be enabled. Otherwise FlashBP will be disabled internally.
- **On**: Enables the FlashBP feature. If no license has been found an error message appears.
- **Off:** Disables the FlashBP feature.
- Show window during program: When this checkbox is enabled the "Programming flash" window is shown when flash is re-programmed in order to set/clear flash breakpoints.

Flash download and flash breakpoints independent settings

These settings do not belong to the J-Link flash download and flash breakpoints settings section. They can be configured without any license needed.

Jink SEGGER - Control panel	
General Settings Breakpoints Log CPU Regs Target Power SWV	Device Emulator M
C:VLink.log	Clear
Settings file Not specified	Cverride
Flash download Flash breakpoints C Auto License found C On C Auto License C On C On ✓ Skip download on CRC match C Off C On Disabled Disabled Disabled	w info window during
Override device selection Allow caching of flash contents (On) Allow instruction set simulation Override memory map Modify breakpoints during execution Allow	I
Ready JLINKARM_GetSpeed (Done) 1.20	8 sec. in 32 calls //.

- **Log file:** Shows the path where the J-Link log file is placed. It is possible to override the selection manually by enabling the Override checkbox. If the Override checkbox is enabled a button appears which let the user choose the new location of the log file.
- **Settings file**: Shows the path where the configuration file is placed. This configuration file contains all the settings which can be configured in the **Settings** tab.
- **Override device selection**: If this checkbox is enabled, a dropdown list appears, which allows the user to set a device manually. This especially makes sense when J-Link can not identify the device name given by the debugger or if a particular device is not yet known to the debugger, but to the J-Link software.
- Allow caching of flash contents: If this checkbox is enabled, the flash contents are cached by J-Link to avoid reading data twice. This speeds up the transfer between debugger and target.
- Allow instruction set simulation: If this checkbox is enabled, instructions will be simulated as far as possible. This speeds up single stepping, especially when FlashBPs are used.
- **Save settings**: When this button is pushed, the current settings in the **Settings** tab will be saved in a configuration file. This file is created by J-Link and will be created for each project and each project configuration (e.g. Debug_RAM, Debug_Flash). If no settings file is given, this button is not visible.
- **Modify breakpoints during execution:** This dropdown box allows the user to change the behavior of the DLL when setting breakpoints if the CPU is running. The following options are available:

Allow: Allows settings breakpoints while the CPU is running. If the CPU needs to be halted in order to set the breakpoint, the DLL halts the CPU, sets the breakpoints and restarts the CPU.

Allow if CPU does not need to be halted: Allows setting breakpoints while the CPU is running, if it does not need to be halted in order to set the breakpoint. If the CPU has to be halted the breakpoint is not set.

Ask user if CPU needs to be halted: If the user tries to set a breakpoint while the CPU is running and the CPU needs to be halted in order to set the breakpoint, the user is asked if the breakpoint should be set. If the breakpoint can be set without halting the CPU, the breakpoint is set without explicit confirmation by the user.

Do not allow: It is not allowed to set breakpoints while the CPU is running.

5.7.1.3 Break/Watch

In the Break/Watch section all breakpoints and watchpoints which are in the DLL internal breakpoint and watchpoint list are shown.

Section: Code

Lists all breakpoints which are in the DLL internal breakpoint list are shown.

- Handle: Shows the handle of the breakpoint.
- **Address**: Shows the address where the breakpoint is set.
- **Mode**: Describes the breakpoint type (ARM/THUMB)
- **Permission**: Describes the breakpoint implementation flags.
- **Implementation**: Describes the breakpoint implementation type. The breakpoint types are: RAM, Flash, Hard. An additional TBC (to be cleared) or TBS (to be set) gives information about if the breakpoint is (still) written to the target or if it's just in the breakpoint list to be written/cleared.

Note: It is possible for the debugger to bypass the breakpoint functionality of the J-Link software by writing to the debug registers directly. This means for ARM7/ ARM9 cores write accesses to the ICE registers, for Cortex-M3 devices write accesses to the memory mapped flash breakpoint registers and in general simple write accesses for software breakpoints (if the program is located in RAM). In these cases, the J-Link software cannot determine the breakpoints set and the list is empty.

Section: Data

In this section, all data breakpoints which are listed in the DLL internal breakpoint list are shown.

- **Handle**: Shows the handle of the data breakpoint.
- Address: Shows the address where the data breakpoint is set.
- AddrMask: Specifies which bits of Address are disregarded during the comparison for a data breakpoint match. (A 1 in the mask means: disregard this bit)
- **Data**: Shows on which data to be monitored at the address where the data breakpoint is set.
- Data Mask: Specifies which bits of Data are disregarded during the comparison
- for a data breakpoint match. (A 1 in the mask means: disregard this bit)
- **Ctrl**: Specifies the access type of the data breakpoint (read/write).
- **CtrlMask**: Specifies which bits of Ctrl are disregarded during the comparison for a data breakpoint match.

5.7.1.4 Log

In this section the log output of the DLL is shown. The user can determine which function calls should be shown in the log window.

Available function calls to log: Register read/write, Memory read/write, set/clear breakpoint, step, go, halt, is halted.

General Settings Break/Watch Log	CPU Regs Target Power SWV
Register write Memory write Register read Memory read	▼BP set ▼Step ▼ Halt ▼BP clear ▼ Go ■ IsHalted <u>Clear log</u>

5.7.1.6 Target Power

In this section currently just the power consumption of the target hardware is shown.

J-Link ARM		
General Setting	gs Break/Watch Log CPU Regs Target Powe	r SWV Device MemMap
Current status C Power gn C Power dis	abled C Power enabled abled C Power gisabled	
- Power inform		
Ready	JLINKARM_ExecCommand (Done)	0.008 sec. in 20 calls

5.7.1.7 SWV

In this section SWV information are shown.

J-Link ARM	
General Settings Break/Watch Log CPU Re	gs Target Power SWV
Status UART encoding, 19200 bps	Host buffer 4 MB
Bytes in buffer 0 bytes	Emulator buffer 4 KB
Bytes transferred 23570 bytes	
Refresh counter 1522	
Ready	

- **Status**: Shows the encoding and the baudrate of the SWV data received by the target (Manchester/UART, currently J-Link only supports UART encoding).
- Bytes in buffer: Shows how many bytes are in the DLL SWV data buffer.
- **Bytes transferred**: Shows how many bytes have been transferred via SWV, since the debug session has been started.
- **Refresh counter**: Shows how often the SWV information in this section has been updated since the debug session has been started.
- **Host buffer**: Shows the reserved buffer size for SWV data, on the host side.
- **Emulator buffer**: Shows the reserved buffer size for SWV data, on the emulator side.

5.8 Reset strategies

J-Link / J-Trace supports different reset strategies. This is necessary because there is no single way of resetting and halting a CPU core before it starts to execute instructions. For example reset strategies which use the reset pin can not succeed on targets where the reset pin of the CPU is not connected to the reset pin of the JTAG connector. Reset strategy 0 is always the recommended one because it has been adapted to work on every target even if the reset pin (Pin 15) is not connected.

What is the problem if the core executes some instructions after RESET?

The instructions which are executed can cause various problems. Some cores can be completely "confused", which means they can not be switched into debug mode (CPU can not be halted). In other cases, the CPU may already have initialized some hardware components, causing unexpected interrupts or worse, the hardware may have been initialized with illegal values. In some of these cases, such as illegal PLL settings, the CPU may be operated beyond specification, possibly locking the CPU.

5.8.1 Strategies for ARM 7/9 devices

5.8.1.1 Type 0: Hardware, halt after reset (normal)

The hardware reset pin is used to reset the CPU. After reset release, J-Link continuously tries to halt the CPU. This typically halts the CPU shortly after reset release; the CPU can in most systems execute some instructions before it is halted. The number of instructions executed depends primarily on the JTAG speed: the higher the JTAG speed, the faster the CPU can be halted.

Some CPUs can actually be halted before executing any instruction, because the start of the CPU is delayed after reset release. If a pause has been specified, J-Link waits for the specified time before trying to halt the CPU. This can be useful if a bootloader which resides in flash or ROM needs to be started after reset.

This reset strategy is typically used if nRESET and nTRST are coupled. If nRESET and nTRST are coupled, either on the board or the CPU itself, reset clears the breakpoint, which means that the CPU can not be stopped after reset with the BP@0 reset strategy.

5.8.1.2 Type 1: Hardware, halt with BP@0

The hardware reset pin is used to reset the CPU. Before doing so, the ICE breaker is programmed to halt program execution at address 0; effectively, a breakpoint is set at address 0. If this strategy works, the CPU is actually halted before executing a single instruction.

This reset strategy does not work on all systems for two reasons:

- If nRESET and nTRST are coupled, either on the board or the CPU itself, reset clears the breakpoint, which means the CPU is not stopped after reset.
- Some MCUs contain a bootloader program (sometimes called kernel), which needs to be executed to enable JTAG access.

5.8.1.3 Type 2: Software, for Analog Devices ADuC7xxx MCUs

This reset strategy is a software strategy. The CPU is halted and performs a sequence which causes a peripheral reset. The following sequence is executed:

- The CPU is halted.
- A software reset sequence is downloaded to RAM.
- A breakpoint at address 0 is set.
- The software reset sequence is executed.

This sequence performs a reset of CPU and peripherals and halts the CPU before executing instructions of the user program. It is the recommended reset sequence for Analog Devices ADuC7xxx MCUs and works with these chips only.

5.8.1.4 Type 3: No reset

No reset is performed. Nothing happens.

5.8.1.5 Type 4: Hardware, halt with WP

The hardware RESET pin is used to reset the CPU. After reset release, J-Link continuously tries to halt the CPU using a watchpoint. This typically halts the CPU shortly after reset release; the CPU can in most systems execute some instructions before it is halted.

The number of instructions executed depends primarily on the JTAG speed: the higher the JTAG speed, the faster the CPU can be halted. Some CPUs can actually be halted before executing any instruction, because the start of the CPU is delayed after reset release

5.8.1.6 Type 5: Hardware, halt with DBGRQ

The hardware RESET pin is used to reset the CPU. After reset release, J-Link continuously tries to halt the CPU using the DBGRQ. This typically halts the CPU shortly after reset release; the CPU can in most systems execute some instructions before it is halted.

The number of instructions executed depends primarily on the JTAG speed: the higher the JTAG speed, the faster the CPU can be halted. Some CPUs can actually be halted before executing any instruction, because the start of the CPU is delayed after reset release.

5.8.1.7 Type 6: Software

This reset strategy is only a software reset. "Software reset" means basically no reset, just changing the CPU registers such as PC and CPSR. This reset strategy sets the CPU registers to their after-Reset values:

- PC = 0
- CPSR = 0xD3 (Supervisor mode, ARM, IRQ / FIQ disabled)
- All SPSR registers = 0x10
- All other registers (which are unpredictable after reset) are set to 0.
- The hardware RESET pin is not affected.

5.8.1.8 Type 7: Reserved

Reserved reset type.

5.8.1.9 Type 8: Software, for ATMEL AT91SAM7 MCUs

The reset pin of the device is disabled by default. This means that the reset strategies which rely on the reset pin (low pulse on reset) do not work by default. For this reason a special reset strategy has been made available.

It is recommended to use this reset strategy. This special reset strategy resets the peripherals by writing to the RSTC_CR register. Resetting the peripherals puts all peripherals in the defined reset state. This includes memory mapping register, which means that after reset flash is mapped to address 0. It is also possible to achieve the same effect by writing 0x4 to the RSTC_CR register located at address 0xffffd00.

5.8.1.10 Type 9: Hardware, for NXP LPC MCUs

After reset a bootloader is mapped at address 0 on ARM 7 LPC devices. This reset strategy performs a reset via reset strategy Type 1 in order to reset the CPU. It also ensures that flash is mapped to address 0 by writing the MEMMAP register of the LPC. This reset strategy is the recommended one for all ARM 7 LPC devices.

5.8.2 Strategies for Cortex-M devices

J-Link supports different specific reset strategies for the Cortex-M cores. All of the following reset strategies are available in JTAG and in SWD mode. All of them halt the CPU after the reset.

Note: It is recommended that the correct device is selected in the debugger so the debugger can pass the device name to the J-Link DLL which makes it possible for J-Link to detect what is the best reset strategy for the device. Moreover, we recommend that the debugger uses reset type 0 to allow J-Link to dynamically select what reset is the best for the connected device.

5.8.2.1 Type 0: Normal

This is the default strategy. It does whatever is the best way to reset the target device.

If the correct device is selected in the debugger this reset strategy may also perform some special handling which might be necessary for the connected device. This for example is the case for devices which have a ROM bootloader that needs to run after reset and before the user application is started (especially if the debug interface is disabled after reset and needs to be enabled by the ROM bootloader).

For most devices, this reset strategy does the same as reset strategy 8 does:

- 1. Make sure that the device halts immediately after reset (before it can execute any instruction of the user application) by setting the VC_CORERESET in the DEMCR.
- 2. Reset the core and peripherals by setting the SYSRESETREQ bit in the AIRCR.
- 3. Wait for the s_RESET_ST bit in the DHCSR to first become high (reset active) and then low (reset no longer active) afterwards.
- 4. Clear VC_CORERESET.

5.8.2.2 Type 1: Core

Only the core is reset via the VECTRESET bit. The peripherals are not affected. After setting the VECTRESET bit, J-Link waits for the S_RESET_ST bit in the Debug Halting Control and Status Register (DHCSR) to first become high and then low afterwards. The CPU does not start execution of the program because J-Link sets the VC_CORERESET bit before reset, which causes the CPU to halt before execution of the first instruction.

Note: In most cases it is not recommended to reset the core only since most target applications rely of the reset state of some peripherals (PLL, External memory interface etc.) and may be confused if they boot up but the peripherals are already configured.

5.8.2.3 Type 2: ResetPin

J-Link pulls its RESET pin low to reset the core and the peripherals. This normally causes the CPU RESET pin of the target device to go low as well, resulting in a reset of both CPU and peripherals. This reset strategy will fail if the RESET pin of the target device is not pulled low. The CPU does not start execution of the program because J-Link sets the VC_CORERESET bit before reset, which causes the CPU to halt before execution of the first instruction.

5.8.2.4 Type 3: Connect under Reset

J-Link connects to the target while keeping Reset active (reset is pulled low and remains low while connecting to the target). This is the recommended reset strategy for STM32 devices. This reset strategy has been designed for the case that communication with the core is not possible in normal mode so the VC_CORERESET bit can not be set in order to guarantee that the core is halted immediately after reset.

5.8.2.5 Type 4: Reset core & peripherals, halt after bootloader

Same as type 0, but bootloader is always executed. This reset strategy has been designed for MCUs/CPUs which have a bootloader located in ROM which needs to run at first, after reset (since it might initialize some target settings to their reset state). When using this reset strategy, J-Link will let the bootloader run after reset and halts the target immediately after the bootloader and before the target application is started. This is the recommended reset strategy for LPC11xx and LPC13xx devices where a bootloader should execute after reset to put the chip into the "real" reset state.

5.8.2.6 Type 5: Reset core & peripherals, halt before bootloader

Basically the same as reset type 8. Performs a reset of core & peripherals and halts the CPU immediately after reset. The ROM bootloader is NOT executed.

5.8.2.7 Type 6: Reset for Freescale Kinetis devices

Performs a via reset strategy 0 (normal) first in order to reset the core & peripherals and halt the CPU immediately after reset. After the CPU is halted, the watchdog is disabled, since the watchdog is running after reset by default. If the target application does not feed the watchdog, J-Link loses connection to the device since it is reset permanently.

5.8.2.8 Type 7: Reset for Analog Devices CPUs (ADI Halt after kernel)

Performs a reset of the core and peripherals by setting the SYSRESETREQ bit in the AIRCR. The core is allowed to perform the ADI kernel (which enables the debug interface) but the core is halted before the first instruction after the kernel is executed in order to guarantee that no user application code is performed after reset.

5.8.2.9 Type 8: Reset core and peripherals

J-Link tries to reset both, core and peripherals by setting the <code>SYSRESETREQ</code> bit in the <code>AIRCR.VC_CORERESET</code> in the <code>DEMCR</code> is also set to make sure that the CPU is halted immediately after reset and before executing any instruction.

Reset procedure:

- 1. Make sure that the device halts immediately after reset (before it can execute any instruction of the user application) by setting the <code>VC_CORERESET</code> in the <code>DEMCR</code>.
- 2. Reset the core and peripherals by setting the SYSRESETREQ bit in the AIRCR.
- 3. Wait for the s_RESET_ST bit in the DHCSR to first become high (reset active) and then low (reset no longer active) afterwards.
- 4. Clear VC_CORERESET.

This type of reset may fail if:

- J-Link has no connection to the debug interface of the CPU because it is in a low power mode.
- The debug interface is disabled after reset and needs to be enabled by a device internal bootloader. This would cause J-Link to lose communication after reset since the CPU is halted before it can execute the internal bootlader.

5.8.2.10 Type 9: Reset for LPC1200 devices

On the NXP LPC1200 devices the watchdog is enabled after reset and not disabled by the bootloader, if a valid application is in the flash memory. Moreover, the watchdog keeps counting if the CPU is in debug mode. When using this reset strategy, J-Link performs a reset of the CPU and peripherals, using the SYSRESETREQ bit in the AIRCR and halts the CPU after the bootloader has been performed and before the first

instruction of the user code is executed. Then the watchdog of the LPC1200 device is disabled. This reset strategy is only guaranteed to work on "modern" J-Links (J-Link V8, J-Link Pro, J-link ULTRA, J-Trace for Cortex-M, J-Link Lite) and if a SWD speed of min. 1 MHz is used. This reset strategy should also work for J-Links with hardware version 6, but it can not be guaranteed that these J-Links are always fast enough in disabling the watchdog.

5.8.2.11 Type 10: Reset for Samsung S3FN60D devices

On the Samsung S3FN60D devices the watchdog may be running after reset (if the watchdog is active after reset or not depends on content of the smart option bytes at addr 0xC0). The watchdog keeps counting even if the CPU is in debug mode (e.g. halted by a halt request or halted by vector catch). When using this reset strategy, J-Link performs a reset of the CPU and peripherals, using the SYSRESETREQ bit and sets VC_CORERESET in order to halt the CPU after reset, before it executes a single instruction. Then the watchdog of the S3FN60D device is disabled.

5.9 Using DCC for memory access

The ARM7/9 architecture requires cooperation of the CPU to access memory when the CPU is running (not in debug mode). This means that memory cannot normally be accessed while the CPU is executing the application program. The normal way to read or write memory is to halt the CPU (put it into debug mode) before accessing memory. Even if the CPU is restarted after the memory access, the real time behavior is significantly affected; halting and restarting the CPU costs typically multiple milliseconds. For this reason, most debuggers do not even allow memory access if the CPU is running.

However, there is one other option: DCC (Direct communication channel) can be used to communicate with the CPU while it is executing the application program. All that is required is the application program to call a DCC handler from time to time. This DCC handler typically requires less than 1 μ s per call.

The DCC handler, as well as the optional DCC abort handler, is part of the J-Link software package and can be found in the $Samples \ DCC \ IAR$ directory of the package.

5.9.1 What is required?

- An application program on the host (typically a debugger) that uses DCC.
- A target application program that regularly calls the DCC handler.
- The supplied abort handler should be installed (optional).

An application program that uses DCC is ${\tt JLink.exe}.$

5.9.2 Target DCC handler

The target DCC handler is a simple C-file taking care of the communication. The function DCC_Process() needs to be called regularly from the application program or from an interrupt handler. If an RTOS is used, a good place to call the DCC handler is from the timer tick interrupt. In general, the more often the DCC handler is called, the faster memory can be accessed. On most devices, it is also possible to let the DCC generate an interrupt which can be used to call the DCC handler.

5.9.3 Target DCC abort handler

An optional DCC abort handler (a simple assembly file) can be included in the application. The DCC abort handler allows data aborts caused by memory reads/writes via DCC to be handled gracefully. If the data abort has been caused by the DCC communication, it returns to the instruction right after the one causing the abort, allowing the application program to continue to run. In addition to that, it allows the host to detect if a data abort occurred.

In order to use the DCC abort handler, 3 things need to be done:

- Place a branch to DCC_Abort at address 0x10 ("vector" used for data aborts).
- Initialize the Abort-mode stack pointer to an area of at least 8 bytes of stack memory required by the handler.
- Add the DCC abort handler assembly file to the application.

5.10 The J-Link settings file

Most IDEs provide a path to a J-Link settings file on a per-project-per-debug-configuration basis. This file is used by J-Link to store various debug settings that shall survive between debug sessions of a project. It also allows the user to perform some override of various settings. If a specific behavior / setting can be overridden via the settings file, is explained in the specific sections that describe the behavior / setting. Since the location and name of the settings file is different for various IDEs, in the following the location and naming convention of the J-Link settings file for various IDEs is explained.

5.10.1 SEGGER Embedded Studio

Settings file with default settings is created on first start of a debug session. There is one settings file per build configuration for the project.

Naming is: _<ProjectName>_<DebugConfigName>.jlink

The settings file is created in the same directory where the project file (*.emProject) is located.

Example: The SES project is called "MyProject" and has two configurations "Debug" and "Release". For each of the configurations, a settings file will be created at the first start of the debug session:

_MyProject_Debug.jlink _MyProject_Release.jlink

5.10.2 Keil MDK-ARM (uVision)

Settings file with default settings is created on first start of a debug session. There is one settings file per project.

Naming is: JLinksettings.ini

The settings file is created in the same directory where the project file (*.uvprojx) is located.

5.10.3 IAR EWARM

Settings file with default settings is created on first start of a debug session. There is one settings file per build configuration for the project.

Naming is: <ProjectName>_<DebugConfig>.jlink

The settings file is created in a "settings" subdirectory where the project file is located.

5.10.4 Mentor Sourcery CodeBench for ARM

CodeBench does not directly specify a J-Link settings file but allows the user to specify a path to one in the project settings under **Debugger -> Settings File**. We recommend to copy the J-Link settings file template from $JLINK_INST_DIRSSamples_JLink_SettingsFiles_Sample.jlinksettings to the$ directory where the CodeBench project is located, once when creating a new project.Then select this file in the project options.

5.11 J-Link script files

In some situations it it necessary to customize some actions performed by J-Link. In most cases it is the connection sequence and/or the way in which a reset is performed by J-Link, since some custom hardware needs some special handling which cannot be integrated into the generic part of the J-Link software. J-Link script files are written in C-like syntax in order to have an easy start to learning how to write J-Link script files. The script file syntax supports most statements (if-else, while, declaration of variables, ...) which are allowed in C, but not all of them. Moreover, there are some statements that are script file specific. The script file allows maximum flexibility, so almost any target initialization which is necessary can be supported.

5.11.1 Actions that can be customized

The script file support allows customizing of different actions performed by J-Link. Depending on whether the corresponding function is present in the script file or not, a generically implemented action is replaced by an action defined in a script file. In the following all J-Link actions which can be customized using a script file are listed and explained.

5.11.1.1 ConfigTargetSettings()

Description

Called before InitTarget(). Maninly used to set some global DLL variables to customize the normal connect procedure. For ARM CoreSight devices this may be specifying the base address of some CoreSight components (ETM, ...) that cannot be autodetected by J-Link due to erroneous ROM tables etc. May also be used to specify the device name in case debugger does not pass it to the DLL.

Prototype

void ConfigTargetSettings(void);

Notes / Limitations

- May not, under absolutely NO circumstances, call any API functions that perform target communication.
- Should only set some global DLL variables

5.11.1.2 InitTarget()

Description

Replaces the target-CPU-auto-find procedure of the J-Link DLL. Useful for target CPUs that are not accessible by default and need some special steps to be executed before the normal debug probe connect procedure can be executed successfully. Example devices are MCUs from TI which have a so-called ICEPick JTAG unit on them that needs to be configured via JTAG, before the actual CPU core is accessible via JTAG.

Prototype

void InitTarget(void);

Notes / Limitations

- If target interface JTAG is used: JTAG chain has to be specified manually before leaving this function (meaning all devices and their TAP IDs have to be specified by the user). Also appropriate JTAG TAP number to communicate with during the debug session has to be manually specified in this function.
- MUST NOT use any MEM_ API functions
- Global DLL variable "CPU" MUST be set when implementing this function, so the DLL knows which CPU module to use internally.

5.11.1.3 SetupTarget()

Description

If present, called after InitTarget() and after general debug connect sequence has been performed by J-Link. Usually used for more high-level CPU debug setup like writing certain memory locations, initializing PLL for faster download etc.

Prototype

void SetupTarget(void);

Notes / Limitations

- Does not replace any DLL functionality but extends it.
- May use MEM_ API functions

5.11.1.4 ResetTarget()

Description

Replaces reset strategies of DLL. No matter what reset type is selected in the DLL, if this function is present, it will be called instead of the DLL internal reset

Prototype

void ResetTarget(void);

Notes / Limitations

- DLL expects target CPU to be halted / in debug mode, when leaving this function
- May use MEM_ API functions

5.11.1.5 InitEMU()

Description

If present, it allows configuration of the emulator prior to starting target communication. Currently this function is only used to configure whether the target which is connected to J-Link has an ETB or not. For more information on how to configure the existence of an ETB, please refer to *Global DLL variables* on page 213.

Prototype

void InitEMU(void);

5.11.1.6 OnTraceStop()

Description

Called right before capturing of trace data is stopped on the J-Link / J-Trace. On some target, an explicit flush of the trace FIFOs is necessary to get the latest trace data. If such a flush is not performed, the latest trace data may not be output by the target

Prototype

void OnTraceStop(void);

Notes / Limitations

• May use MEM_ functions

5.11.2 Script file API functions

In the following, the API functions which can be used in a script file to communicate with the DLL are explained.

208

5.11.2.1 MessageBox()

Description

Outputs a string in a message box.

Prototype

___api___ int MessageBox(const char * sMsg);

5.11.2.2 MessageBox1()

Description

Outputs a constant character string in a message box. In addition to that, a given value (can be a constant value, the return value of a function or a variable) is added, right behind the string.

Prototype

__api__ int MessageBox1(const char * sMsg, int v);

5.11.2.3 Report()

Description

Outputs a constant character string on stdio.

Prototype

___api___ int Report(const char * sMsg);

5.11.2.4 Report1()

Description

Outputs a constant character string on stdio. In addition to that, a given value (can be a constant value, the return value of a function or a variable) is added, right behind the string.

Prototype

__api__ int Report1(const char * sMsg, int v);

5.11.2.5 JTAG_SetDeviceId()

Description

Sets the JTAG ID of a specified device, in the JTAG chain. The index of the device depends on its position in the JTAG chain. The device closest to TDO has index 0. The Id is used by the DLL to recognize the device.

Before calling this function, please make sure that the JTAG chain has been configured correctly by setting the appropriate global DLL variables. For more information about the known global DLL variables, please refer to *Global DLL variables* on page 213.

Prototype

___api___ int JTAG_SetDeviceId(int DeviceIndex, unsigned int Id);

5.11.2.6 JTAG_GetDeviceId()

Description

Retrieves the JTAG ID of a specified device, in the JTAG chain. The index of the device depends on its position in the JTAG chain. The device closest to TDO has index 0.

Prototype

___api___ int JTAG_GetDeviceId(int DeviceIndex);

5.11.2.7 JTAG_WriteIR()

Description

Writes a JTAG instruction.

Before calling this function, please make sure that the JTAG chain has been configured correctly by setting the appropriate global DLL variables. For more information about the known global DLL variables, please refer to *Global DLL variables* on page 213.

Prototype

___api___ int JTAG_WriteIR(unsigned int Cmd);

5.11.2.8 JTAG_StoreIR()

Description

Stores a JTAG instruction in the DLL JTAG buffer.

Before calling this function, please make sure that the JTAG chain has been configured correctly by setting the appropriate global DLL variables. For more information about the known global DLL variables, please refer to *Global DLL variables* on page 213.

Prototype

___api___ int JTAG_StoreIR(unsigned int Cmd);

5.11.2.9 JTAG_WriteDR()

Description

Writes JTAG data.

Before calling this function, please make sure that the JTAG chain has been configured correctly by setting the appropriate global DLL variables. For more information about the known global DLL variables, please refer to *Global DLL variables* on page 213.

Prototype

___api___ int JTAG_WriteDR(unsigned ___int64 tdi, int NumBits);

5.11.2.10JTAG_StoreDR()

Description

Stores JTAG data in the DLL JTAG buffer.

Before calling this function, please make sure that the JTAG chain has been configured correctly by setting the appropriate global DLL variables. For more information about the known global DLL variables, please refer to *Global DLL variables* on page 213.

Prototype

___api___ int JTAG_StoreDR(unsigned ___int64 tdi, int NumBits);

5.11.2.11JTAG_Write()

Description

Writes a JTAG sequence (max. 64 bits per pin).

Prototype

```
___api___ int JTAG_Write(unsigned ___int64 tms, unsigned ___int64 tdi, int NumBits);
```

5.11.2.12JTAG_Store()

Description

Stores a JTAG sequence (max. 64 bits per pin) in the DLL JTAG buffer.

Prototype

```
__api__ int JTAG_Store(unsigned __int64 tms, unsigned __int64 tdi, int NumBits);
```

5.11.2.13JTAG_GetU32()

Description

Gets 32 bits JTAG data, starting at given bit position.

Prototype

___api___ int JTAG_GetU32(int BitPos);

5.11.2.14JTAG_WriteClocks()

Description

Writes a given number of clocks.

Prototype

___api___ int JTAG_WriteClocks(int NumClocks);

5.11.2.15JTAG_StoreClocks()

Description

Stores a given number of clocks in the DLL JTAG buffer.

Prototype

___api___ int JTAG_StoreClocks(int NumClocks);

5.11.2.16JTAG_Reset()

Description

Performs a TAP reset and tries to auto-detect the JTAG chain (Total IRLen, Number of devices). If auto-detection was successful, the global DLL variables which determine the JTAG chain configuration, are set to the correct values. For more information about the known global DLL variables, please refer to *Global DLL variables* on page 213.

Note: This will not work for devices which need some special init (for example to add the core to the JTAG chain), which is lost at a TAP reset.

Prototype

```
__api__ int JTAG_Reset(void);
```

5.11.2.17SYS_Sleep()

Description

Waits for a given number of miliseconds. During this time, J-Link does not communicate with the target.

__api__ int SYS_Sleep(int Delayms);

5.11.2.18 JLINK_CORESIGHT_AddAP()

Description

Allows the user to manually configure the AP-layout of the device J-Link is connected to. This makes sense on targets on which J-Link can not perform a auto-detection of the APs which are present on the target system. Type can only be a known global J-Link DLL AP constant. For a list of all available constants, please refer to *Global DLL constants* on page 217.

Prototype

___api___ int JLINK_CORESIGHT_AddAP(int Index, unsigned int Type);

Example

```
JLINK_CORESIGHT_AddAP(0, CORESIGHT_AHB_AP); // First AP is a AHB-AP
JLINK_CORESIGHT_AddAP(1, CORESIGHT_APB_AP); // Second AP is a APB-AP
JLINK_CORESIGHT_AddAP(2, CORESIGHT_JTAG_AP); // Third AP is a JTAG-AP
```

5.11.2.19JLINK_CORESIGHT_Configure()

Description

Has to be called once, before using any other $_\text{CORESIGHT}_$ function that accesses the DAP.

Takes a configuration string to prepare target and J-Link for CoreSight function usage. Configuration string may contain multiple setup parameters that are set. Setup parameters are separated by a semicolon.

At the end of the JLINK_CORESIGHT_Configure(), the appropriate target interface switching sequence for the currently active target interface is output, if not disabled via setup parameter.

This function has to be called again, each time the JTAG chain changes (for dynamically changing JTAG chains like those which include a TI ICEPick), in order to setup the JTAG chain again.

For JTAG

The SWD -> JTAG switching sequence is output. This also triggers a TAP reset on the target (TAP controller goes through -> Reset -> Idle state)

The IRPre, DRPre, IRPost, DRPost parameters describe which device inside the JTAG chain is currently selected for communication.

For SWD

The JTAG -> SWD switching sequence is output.

It is also made sure that the "overrun mode enable" bit in the SW-DP CTRL/STAT register is cleared, as in SWD mode J-Link always assumes that overrun detection mode is disabled.

Make sure that this bit is NOT set by accident when writing the SW-DP CTRL/STAT register via the $_CORESIGHT_$ functions.

Prototype

int JLINK_CORESIGHT_Configure(const char* sConfig);

Example

```
if (MAIN_ActiveTIF == JLINK_TIF_JTAG) {
    // Simple setup where we have TDI -> Cortex-M (4-bits IRLen) -> TDO
    JLINK_CORESIGHT_Configure("IRPre=0;DRPre=0;IRPost=0;DRPost=0;IRLenDevice=4");
} else {
    // For SWD, no special setup is needed, just output the switching sequence
    JLINK_CORESIGHT_Configure("");
```

```
}
v = JLINK_CORESIGHT_ReadDP(JLINK_CORESIGHT_DP_REG_CTRL_STAT);
Report1("DAP-CtrlStat: " v);
// Complex setup where we have TDI -> ICEPick (6-bits IRLen) -> Cortex-M (4-bits
IRLen) -> TDO
JLINK_CORESIGHT_Configure("IRPre=0;DRPre=0;IRPost=6;DRPost=1;IRLenDevice=4;");
v = JLINK_CORESIGHT_ReadDP(JLINK_CORESIGHT_DP_REG_CTRL_STAT);
Report1("DAP-CtrlStat: " v)
```

Known setup parameters

Parameter	Туре	Explanation
IRPre	DecValue	Sum of IRLen of all JTAG devices in the JTAG chain, closer to TDO than the actual one J-Link shall commu- nicate with.
DRPre	DecValue	Number of JTAG devices in the JTAG chain, closer to TDO than the actual one, J-Link shall communicate with.
IRPost	DecValue	Sum of IRLen of all JTAG devices in the JTAG chain, fol- lowing the actual one, J-Link shall communicate with.
DRPost	DecValue	Number of JTAG devices in the JTAG chain, following the actual one, J-Link shall communicate with.
IRLenDevice	DecValue	IRLen of the actual device, J-Link shall communicate with.
PerformTIFInit	DecValue	0: Do not output switching sequence etc. once JLINK_CORESIGHT_Configure() completes.

5.11.2.20JLINK_CORESIGHT_ReadAP()

Description

Reads a specific AP register.

For JTAG, makes sure that AP is selected automatically.

Makes sure that actual data is returned, meaning for register read-accesses which usually only return data on the second access, this function performs this automatically, so the user will always see valid data.

Prototype

int JLINK_CORESIGHT_ReadAP(unsigned int RegIndex);

Example

```
v = JLINK_CORESIGHT_ReadAP(JLINK_CORESIGHT_AP_REG_DATA);
Report1("DATA: " v);
```

5.11.2.21JLINK_CORESIGHT_ReadDP()

Description

Reads a specific DP register. For JTAG, makes sure that DP is selected automatically. Makes sure that actual data is returned, meaning for register read-accesses which usually only return data on the second access, this function performs this automatically, so the user will always see valid data.

Prototype

int JLINK_CORESIGHT_ReadDP(unsigned int RegIndex);

Example

```
v = JLINK_CORESIGHT_ReadDP(JLINK_CORESIGHT_DP_REG_IDCODE);
Report1("DAP-IDCODE: " v);
```

5.11.2.22JLINK_CORESIGHT_WriteAP()

Description

Writes a specific AP register. For JTAG, makes sure that AP is selected automatically.

Prototype

int JLINK_CORESIGHT_WriteAP(unsigned int RegIndex, unsigned int Data);

Example

JLINK_CORESIGHT_WriteAP(JLINK_CORESIGHT_AP_REG_BD1, 0x1E);

5.11.2.23JLINK_CORESIGHT_WriteDP()

Description

Writes a specific DP register. For JTAG, makes sure that DP is selected automatically.

Prototype

int JLINK_CORESIGHT_WriteDP(unsigned int RegIndex, unsigned int Data);

Example

JLINK_CORESIGHT_WriteDP(JLINK_CORESIGHT_DP_REG_ABORT, 0x1E);

5.11.3 Global DLL variables

The script file feature also provides some global variables which are used for DLL configuration. Some of these variables can only be set to some specific values, others can be set to the whole datatype with. In the following all global variables and their value ranges are listed and described.

Note: All global variables are treated as unsigned 32-bit values and are zero-initialized.

Legend

- RO: Variable is read-only
- WO: Variable is write-only
- R/W: Variable is read-write

Variable	Description	R/W
CPU	Pre-selects target CPU J-Link is communicating with. Used in InitTarget() to skip the core auto- detection of J-Link. This variable can only be set to a known global J-Link DLL constant. For a list of all valid values, please refer to <i>Global DLL con-</i> <i>stants</i> on page 217. Example CPU = ARM926EJS;	wo
JTAG_IRPre	Used for JTAG chain configuration. Sets the num- ber of IR-bits of all devices which are closer to TDO than the one we want to communicate with. Example JTAG_IRPre = 6;	R/W
JTAG_DRPre	Used for JTAG chain configuration. Sets the num- ber of devices which are closer to TDO than the one we want to communicate with. Example JTAG_DRPre = 2;	RO

Table 5.11: Global DLL variables

J-Link / J-Trace (UM08001)

Variable	Description	R/W
JTAG_IRPost	Used for JTAG chain configuration. Sets the num- ber of IR-bits of all devices which are closer to TDI than the one we want to communicate with. Example JTAG_IRPost = 6;	RO
JTAG_DRPost	Used for JTAG chain configuration. Sets the num- ber of devices which are closer to TDI than the one we want to "communicate with. Example JTAG_DRPost = 0;	RO
JTAG_IRLen	<pre>IR-Len (in bits) of the device we want to commu- nicate with. Example JTAG_IRLen = 4;</pre>	RO
JTAG_TotalIRLen	<pre>Computed automatically, based on the values of JTAG_IRPre, JTAG_DRPre, JTAG_IRPost and JTAG_DRPost. Example v = JTAG_TotalIRLen;</pre>	RO
JTAG_AllowTAPReset	En-/Disables auto-JTAG-detection of J-Link. Has to be disabled for devices which need some spe- cial init (for example to add the core to the JTAG chain), which is lost at a TAP reset. Allowed values 0 Auto-detection is enabled. 1 Auto-detection is disabled.	WO
JTAG_Speed	Sets the JTAG interface speed. Speed is given in kHz. Example JTAG_Speed = 2000; // 2MHz JTAG speed	R/W
JTAG_ResetPin	<pre>Pulls reset pin low / Releases nRST pin. Used to issue a reset of the CPU. Value assigned to reset pin reflects the state. 0 = Low, 1 = high. Example JTAG_ResetPin = 0; SYS_Sleep(5); // Give pin some time to get low JTAG_ResetPin = 1;</pre>	WO
JTAG_TRSTPin	<pre>Pulls reset pin low / Releases nTRST pin. Used to issue a reset of the debug logic of the CPU. Value assigned to reset pin reflects the state. 0 = Low, 1 = high. Example JTAG_TRSTPin = 0; SYS_Sleep(5); // Give pin some time to get low JTAG_TRSTPin = 1;</pre>	WO
JTAG_TCKPin	Pulls TCK pin LOW / HIGH. Value assigned to reset pin reflects the state. 0 = LOW, 1 = HIGH. Example JTAG_TCKPin = 0;	R/W
JTAG_TDIPin	Pulls TDI pin LOW / HIGH. Value assigned to reset pin reflects the state. 0 = LOW, 1 = HIGH. Example JTAG_TDIPin = 0;	R/W
JTAG_TMSPin	Pulls TMS pin LOW / HIGH. Value assigned to reset pin reflects the state. 0 = LOW, 1 = HIGH. Example JTAG_TMSPin = 0;	R/W

Table 5.11: Global DLL variables

Variable	Description	R/W
EMU_ETB_IsPresent	<pre>If the connected device has an ETB and you want to use it with J-Link, this variable should be set to 1. Setting this variable in another function as InitEmu() does not have any effect. Example void InitEmu(void) { EMU_ETB_IsPresent = 1; }</pre>	wo
EMU_ETB_UseETB	Uses ETB instead of RAWTRACE capability of the emulator. Setting this variable in another func- tion as InitEmu() does not have any effect. Example EMU_ETB_USETB = 0;	RO
EMU_ETM_IsPresent	<pre>Selects whether an ETM is present on the target or not. Setting this variable in another function as InitEmu() does not have any effect. Example EMU_ETM_IsPresent= 0;</pre>	R/W
EMU_ETM_UseETM	<pre>Uses ETM as trace source. Setting this variable in another function as InitEmu() does not have any effect. Example EMU_ETM_UseETM = 1;</pre>	WO
EMU_JTAG_ DisableHWTransmissions	Disables use of hardware units for JTAG trans- missions since this can cause problems on some hardware designs. Example EMU_JTAG_DisableHWTransmissions = 1;	WO
CORESIGHT_CoreBaseAddr	Sets base address of core debug component for CoreSight compliant devices. Setting this vari- able disables the J-Link auto-detection of the core debug component base address. Used on devices where auto-detection of the core debug component base address is not possible due to incorrect CoreSight information. Example CORESIGHT_CoreBaseAddr = 0x80030000;	R/W
CORESIGHT_ IndexAHBAPToUse	<pre>Pre-selects an AP as an AHB-AP that J-Link uses for debug communication (Cortex-M). Setting this variable is necessary for example when debugging multi-core devices where multiple AHB-APs are present (one for each device). This function can only be used if a AP-layout has been configured via JLINK_CORESIGHT_AddAP(). Example JLINK_CORESIGHT_AddAP(0, CORESIGHT_AHB_AP); JLINK_CORESIGHT_AddAP(1, CORESIGHT_AHB_AP); JLINK_CORESIGHT_AddAP(2, CORESIGHT_AHB_AP); JLINK_CORESIGHT_AddAP(2, CORESIGHT_APB_AP); // // Use second AP as AHB-AP // for target communication // CORESIGHT_IndexAHBAPToUse = 1;</pre>	WO

Variable	Description	R/W
CORESIGHT_ IndexAPBAPToUse	<pre>Pre-selects an AP as an APB-AP that J-Link uses for debug communication (Cortex-A/R). Setting this variable is necessary for example when debugging multi-core devices where multiple APB-APs are present (one for each device). This function can only be used if an AP-layout has been configured via JLINK_CORESIGHT_AddAP(). Example JLINK_CORESIGHT_AddAP(0, CORESIGHT_AHB_AP); JLINK_CORESIGHT_AddAP(1, CORESIGHT_APB_AP); JLINK_CORESIGHT_AddAP(2, CORESIGHT_APB_AP); JLINK_CORESIGHT_AddAP(2, CORESIGHT_APB_AP); // // Use third AP as APB-AP // for target communication // CORESIGHT_IndexAPBAPToUse = 2;</pre>	WO
CORESIGHT_ AHBAPCSWDefaultSetting s	Overrides the default settings to be used by the DLL when configuring the AHB-AP CSW register. By default, the J-Link DLL will use the following settings for the CSW: Cortex-M0, M0+, M3, M4 [30] == 0 [28] == 0 [28] == 0 [26] == 0 [26] == 0 [25] == 1 [24] == 1 Configurable settings [30] == SPROT: 0 == secure transfer request [28] == HRPOT[4]: Always 0 [27] == HRPOT[3]: 0 == uncachable [26] == HRPOT[2]: 0 == unbufferable [26] == HRPOT[1]: 0 == unpriviledged	WO

Table 5.11: Global DLL variables

Variable	Description	R/W
MAIN_ResetType	<pre>Used to determine what reset type is currently selected by the debugger. This is useful, if the script has to behave differently in case a specific reset type is selected by the debugger and the script file has a ResetTarget() function which overrides the J-Link reset strategies. Example if (MAIN_ResetType == 2) { [] } else { [] }</pre>	RO
MAIN_ActiveTIF	Returns the currently used target interface used by the DLL to communicate with the target. Use- ful in cases where some special setup only needs to be done for a certain target interface, e.g. JTAG. For a list of possible values this variable may hold, please refer to <i>Constants for global variable</i> <i>"MAIN_ActiveTIF"</i> on page 218.	RO
MAIN_IsFirstIdentify	<pre>Used to check if this is the first time we are run- ning into InitTarget(). Useful if some init steps only need to be executed once per debug ses- sion.Example if (MAIN_IsFirstIdentify == 1) { [] } else { [] }</pre>	RO

Table 5.11: Global DLL variables

5.11.4 Global DLL constants

Currently there are only global DLL constants to set the global DLL variable $_{CPU}$. If necessary, more constants will be implemented in the future.

5.11.4.1 Constants for global variable: CPU

The following constants can be used to set the global DLL variable CPU:

- ARM7
- ARM7TDMI
- ARM7TDMIR3
- ARM7TDMIR4
- ARM7TDMIS
- ARM7TDMISR3
- ARM7TDMISR4
- ARM9
- ARM9TDMIS
- ARM920T
- ARM922T
- ARM926EJS
- ARM926EJS
 ARM946EJS
- ARM966ES
- ARM968ES
- ARM11
- ARM1136
- ARM1136
 ARM1136J
- ARM1136JS
- ARM1136JF
- ARM1136JFS

- ARM1156
- ARM1176
- ARM1176J
- ARM1176JS
- ARM1176IF
- ARM1176JFS
- CORTEX_M0
- CORTEX_M1
- CORTEX_M3
- CORTEX_M3R1P0
- CORTEX_M3R1P1
- CORTEX_M3R2P0
- CORTEX_M4
- CORTEX_M7
- CORTEX_A5
- CORTEX_A7
- CORTEX_A8
- CORTEX_A9
- CORTEX_A12
- CORTEX_A15
- CORTEX_A17
- CORTEX_R4
- CORTEX_R5

5.11.4.2 Constants for "JLINK_CORESIGHT_xxx" functions

APs

- CORESIGHT_AHB_AP
- CORESIGHT_APB_AP
- CORESIGHT_JTAG_AP
- CORESIGHT_CUSTOM_AP

DP/AP register indexes

- JLINK_CORESIGHT_DP_REG_IDCODE
- JLINK_CORESIGHT_DP_REG_ABORT
- JLINK_CORESIGHT_DP_REG_CTRL_STAT
- JLINK_CORESIGHT_DP_REG_SELECT
- JLINK_CORESIGHT_DP_REG_RDBUF
- JLINK_CORESIGHT_AP_REG_CTRL
- JLINK_CORESIGHT_AP_REG_ADDR
- JLINK_CORESIGHT_AP_REG_DATA
- JLINK_CORESIGHT_AP_REG_BD0
- JLINK_CORESIGHT_AP_REG_BD1
- JLINK_CORESIGHT_AP_REG_BD2
- JLINK_CORESIGHT_AP_REG_BD3
- JLINK_CORESIGHT_AP_REG_ROM
- JLINK_CORESIGHT_AP_REG_IDR

5.11.4.3 Constants for global variable "MAIN_ActiveTIF"

- JLINK_TIF_JTAG
- JLINK_TIF_SWD

5.11.5 Script file language

The syntax of the J-Link script file language follows the conventions of the C-language, but it does not support all expresisons and operators which are supported by the C-language. In the following, the supported operators and expressions are listed.

5.11.5.1 Supported Operators

The following operators are supported by the J-Link script file language:

- Multiplicative operators: *, /, %
- Additive operators: +, -
- Bitwise shift operators: <<, >>)
- Relational operators: <, >, <=, >=
- Equality operators: ==, !=
- Bitwise operators: &, |, ^
- Logical operators: &&, ||
- Assignment operators: =, *=, /=, +=, -=, <<=, >>=, &=, ^=, |=

5.11.5.2 Supported type specifiers

The following type specifiers are supported by the J-Link script file language:

- void
- char
- int (32-bit)
- __int64

5.11.5.3 Supported type qualifiers

The following type qualifiers are supported by the J-Link script file language:

- const
- signed
- unsigned

5.11.5.4 Supported declarators

The following type qualifiers are supported by the J-Link script file language:

Array declarators

5.11.5.5 Supported selection statements

The following selection statements are supported by the J-Link script file language:

- if-statements
- if-else-statements

5.11.5.6 Supported iteration statements

The following iteration statements are supported by the J-Link script file language:

- while
- do-while

5.11.5.7 Jump statements

The following jump statements are supported by the J-Link script file language:

return

5.11.5.8 Sample script files

The J-Link software and documentation package comes with sample script files for different devices. The sample script files can be found at <code>\$JLINK_INST_DIR\$\Samples\JLink\Scripts</code>.

5.11.6 Script file writing example

In the following, a short example of how a J-Link script file could look like. In this example we assume a JTAG chain with two devices on it (Cortex-A8 4 bits IRLen, custom device 5-bits IRLen).

```
void InitTarget(void) {
  Report("J-Link script example.");
                                  // Perform TAP reset and J-Link JTAG auto-detection // Basic check if JTAG chain information matches
  JTAG Reset();
  if (JTAG_TotalIRLen != 9) {
    MessageBox("Can not find xxx device");
    return 1;
  }
  JTAG_DRPre
                            = 0; // Cortex-A8 is closest to TDO, no no pre devices
                            = 1; // 1 device (custom device) comes after the Cortex-A8
  JTAG_DRPost
                            = 0; // Cortex-A8 is closest to TDO, no no pre IR bits
  JTAG_IRPre
JTAG_IRPost
                            = 5; // custom device after Cortex-A8 has 5 bits IR len
                            = 4; // We selected the Cortex-A8, it has 4 bits IRLen
  JTAG_IRLen
                            = CORTEX_A8; // We are connected to a Cortex-A8
= 1; // We are allowed to enter JTAG TAP reset
  CPU
  JTAG_AllowTAPReset
  11
  // We have a non-CoreSight compliant Cortex-A8 here
  \ensuremath{\prime\prime}\xspace which does not allow auto-detection of the Core debug components base address.
  // so set it manually to overwrite the DLL auto-detection
  11
  CORESIGHT_CoreBaseAddr = 0x80030000;
ļ
```

5.11.7 Executing J-Link script files

5.11.7.1 In J-Link commander

When J-Link commander is started it searches for a script file called Default.JLinkScript in the folder wich contains the JLink.exe and the J-Link DLL (by default the installation folder e.g. "C:\Program Files\SEGGER\JLinkARM_V456\"). If this file is found, it is executed instead of the standard auto detection of J-Link. If this file is not present, J-Link commander behaves as before and the normal auto-detection is performed.

5.11.7.2 In Keil MDK-ARM

Keil MDK-ARM does not provide any native support for J-Link script files so usage of them cannot be configured from within the GUI of the IDE itself. Anyhow, it is possible to use a J-Link script file by making use of the auto-search feature of the DLL:

 Navigate to the folder where the uVision project (*.uvproj, *.uvprojx) is located that shall use the script file.

Rename the J-Link script to JLinkSettings.JLinkScript

The JLinkSettings.ini is a settings file created by the J-Link DLL on debug session start. If no script file is explicitly passed to the DLL, it will search in the directory of the JLinkSettings.ini for a script file named like the settings file only with a different file extension.

5.11.7.3 In IAR EWARM

IAR EWARM does not provide any native support for J-Link script files so usage of them cannot be configured from within the GUI of the IDE itself. Anyhow, it is possible to use a J-Link script file by making use of the auto-search feature of the DLL:

- Navigate to the folder where the EWARM project (*.ewp) is located
- On the start of the first debug session EWARM will create a ${\tt settings}$ folder there
- Navigate into this settings folder
- There will be a *.jlink file in this folder for each debug configuration of the current project (e.g. Debug + Release)
- Copy the J-Link script file into this folder
- Rename the J-Link script to *.JLinkScript where * is the same name as the *.jlink file has. Example:
 - MyProject_Debug.jlink

=> Rename J-Link script file to MyProject_Debug.JLinkScript

• On debug session start, the J-Link DLL will search for a *.JLinkScript file with the same name as the J-Link settings file (*.jlink) and if present, the J-Link script file will be used for this session. For more information about how EWARM names the J-Link settings file, please refer to *The J-Link settings file* on page 205.

5.11.7.4 In other debugger IDE environments

To execute a J-Link script file out of your debugger IDE, simply select the script file to execute in the Settings tab of the J-Link control panel and click the save button (after the debug session has been started). Usually a project file for J-Link is set by the debugger, which allows the J-Link DLL to save the settings of the control panel in this project file. After selecting the script file restart your debug session. From now on, the script file will be executed when starting the debug session.

5.11.7.5 In GDB Server

In order to execute a script file when using J-Link GDB Server, simply start the GDB Server, using the following command line paramter:

-scriptfile <file>

For more information about the *-scriptfile* command line parameter, please refer to *J-Link GDB Server* on page 104.

5.12 Command strings

The behavior of the J-Link can be customized via command strings passed to the JLinkARM.dll which controls J-Link. Applications such as the J-Link Commander, but also the C-SPY debugger which is part of the IAR Embedded Workbench, allow passing one or more command strings. Command line strings can be used for passing commands to J-Link (such as switching on target power supply), as well as customize the behavior (by defining memory regions and other things) of J-Link. The use of command strings enables options which can not be set with the configuration dialog box provided by C-SPY.

5.12.1 List of available commands

The table below lists and describes the available command strings.

Command	Description
AppendToLogFile	Enables/Disables always appending new loginfo to log- file.
CORESIGHT_SetIndexAHBAP ToUse	Selects a specific AHB-AP to be used to connect to a Cortex-M device.
CORESIGHT_SetIndexAPBAP ToUse	Selects a specific APB-AP to be used to connect to a Cortex-A or Cortex-R device.
device	Selects the target device.
DisableAutoUpdateFW	Disables automatic firmware update.
DisableCortexMXPSRAutoC orrectTBit	Disables auto-correction of XPSR T-bit for Cortex-M devices.
DisableFlashBPs	Disables the FlashBP feature.
DisableFlashDL	Disables the J-Link FlashDL feature.
DisableInfoWinFlashBPs	Disables info window for programming FlashBPs.
DisableInfoWinFlashDL	Disables info window for FlashDL.
DisableMOEHandling	Disables output of additional information about mode of entry in case the target CPU is halted / entered debug mode.
DisablePowerSupplyOnClo se	Disables power supply on close.
EnableAutoUpdateFW	Enables automatic firmware update.
EnableEraseAllFlashBank s	Enables erase for all accessible flash banks.
EnableFlashBPs	Enables the FlashBP feature.
EnableFlashDL	Enables the J-Link FlashDL feature.
EnableInfoWinFlashBPs	Enables info window for programming FlashBPs.
EnableInfoWinFlashDL	Enables info window for FlashDL.
EnableMOEHandling	Enables output of additional information about mode of entry in case the target CPU is halted / entered debug mode.
EnableRemarks	Enable detailed output during CPU-detection / connection process.
ExcludeFlashCacheRange	Invalidate flash ranges in flash cache, that are config- ured to be excluded from flash cache.
Hide device selection	Hide device selection dialog.
HSSLogFile	Logs all HSS-Data to file, regardless of the application using HSS.
Turne 1 i de tre Ceretre	Invalidates Cache.
InvalidateCache	
InvalidateFW	Invalidating current firmware.

Table 5.12: Available command strings

Command	Description
map indirectread	Specifies an area which should be read indirect.
map illegal	Marks a specified memory region as an illegal memory
map illegai	area. Memory accesses to this region are ignored.
map ram	Specifies location of target RAM.
map region	Specifies a memory region.
map reset	Restores the default mapping, which means all mem- ory accesses are permitted.
ProjectFile	Specifies a file or directory which should be used by the J-Link DLL to save the current configuration.
ScriptFile	Set script file path.
SelectTraceSource	Selects which trace source should be used for tracing.
SetAllowFlashCache	Enables/Disables flash cache usage.
SetAllowSimulation	Enables/Disables instruction set simulation.
SetBatchMode	Enables/Disables batch mode.
SetCFIFlash	Specifies CFI flash area.
SetCheckModeAfterRead	Enables/Disables CPSR check after read operations.
SetCompareMode	Specifies the compare mode to be used.
SetCPUConnectIDCODE	Specifies an CPU IDCODE that is used to authenticate
	the debug probe, when connecting to the CPU. Used to power-down the debug unit of the target CPU
SetDbgPowerDownOnClose	when the debug session is closed.
SetETBIsPresent	Selects if the connected device has an ETB.
SetETMIsPresent	Selects if the connected device has an ETM.
SetFlashDLNoRMWThreshol	Specifies a threshold when writing to flash memory
d	does not cause a read-modify-write operation.
SetFlashDLThreshold	Set minimum amount of data to be downloaded.
SetIgnoreReadMemErrors	Specifies if read memory errors will be ignored.
SetIgnoreWriteMemErrors	Specifies if write memory errors will be ignored.
SetMonModeDebug	Enables/Disables monitor mode debugging.
SetResetPulseLen	Defines the length of the RESET pulse in milliseconds.
SetResetType	Selects the reset strategy.
SetRestartOnClose	Specifies restart behavior on close.
SetRTTAddr	Set address of the RTT buffer.
SetRTTTelnetPort	Set the port used for RTT telnet.
SetRTTSearchRanges	Set ranges to be searched for RTT buffer.
SetRXIDCode	Specifies an ID Code for Renesas RX devices to be used by the J-Link DLL.
SetSkipProgOnCRCMatch	Specifies the CRC match / compare mode to be used. Deprecated, use <u>SetCompareMode</u> instead.
SetSysPowerDownOnIdle	Used to power-down the target CPU, when there are no transmissions between J-Link and target CPU, for a specified timeframe.
SetVerifyDownload	Specifies the verify option to be used.
SetWorkRAM	Specifies RAM area to be used by the J-Link DLL.
ShowControlPanel	Opens control panel.
SilentUpdateFW	Update new firmware automatically.
SupplyPower	Activates/Deactivates power supply over pin 19 of the JTAG connector.
	Activates/Deactivates power supply over pin 19 of the

 Table 5.12: Available command strings

Command	Description
SuppressControlPanel	Suppress pop up of the control panel.
SuppressInfoUpdateFW	Suppress information regarding firmware updates.
SWOSetConversionMode	Set SWO Conversion mode.

Table 5.12: Available command strings

5.12.1.1 AppendToLogFile

This command can be used to configure the AppendToLogFile feature. If enabled, new log data will always be appended to an existing logfile. Otherwise, each time a new connection will be opened, existing log data will be overwritten. By default new log data will not be always appended to an existing logfile.

Syntax

AppendToLogFile = 0 | 1

Example

AppendToLogFile 1 // Enables AppendToLogFile

5.12.1.2 CORESIGHT_SetIndexAHBAPToUse

This command is used to select a specific AHB-AP to be used when connected to an ARM Cortex-M device. Usually, it is not necessary to explicitly select an AHB-AP to be used, as J-Link auto-detects the AP automatically. For multi-core systems with multiple AHB-APs it might be necessary.

The index selected here is an absolute index. For example, if the connected target provides the following AP layout:

- AP[0]: AHB-AP
- AP[1]: APB-AP
- AP[2]: AHB-AP
- AP[3]: JTAG-AP

In order to select the second AHB-AP to be used, use "2" as index.

Syntax

```
CORESIGHT_SetIndexAHBAPToUse = <Index>
```

Example

CORESIGHT_SetIndexAHBAPToUse = 2

5.12.1.3 CORESIGHT_SetIndexAPBAPToUse

This command is used to select a specific APB-AP to be used when connected to an ARM Cortex-A or Cortex-R device. Usually, it is not necessary to explicitly select an AHB-AP to be used, as J-Link auto-detects the AP automatically. For multi-core systems with multiple APB-APs it might be necessary.

The index selected here is an absolute index. For example, if the connected target provides the following AP layout:

- AP[0]: APB-AP
- AP[1]: AHB-AP
- AP[2]: APB-AP
- AP[3]: JTAG-AP

In order to select the second APB-AP to be used, use "2" as index.

Syntax

```
CORESIGHT_SetIndexAPBAPToUse = <Index>
```

226

Example

CORESIGHT_SetIndexAPBAPToUse = 2

5.12.1.4 device

This command selects the target device.

Syntax

device = <DeviceID>

DeviceID has to be a valid device identifier. For a list of all available device identifiers please refer to chapter *Supported devices* on page 250.

Example

```
device = AT91SAM7S256
```

5.12.1.5 DisableAutoUpdateFW

This command is used to disable the automatic firmware update if a new firmware is available.

Syntax

DisableAutoUpdateFW

5.12.1.6 DisableCortexMXPSRAutoCorrectTBit

Usually, the J-Link DLL auto-corrects the T-bit of the XPSR register to 1, for Cortex-M devices. This is because having it set as 0 is an invalid state and would cause several problems during debugging, especially on devices where the erased state of the flash is 0x00 and therefore on empty devices the T-bit in the XPSR would be 0. Anyhow, if for some reason explicit disable of this auto-correction is necessary, this can be achieved via the following command string.

Syntax

DisableCortexMXPSRAutoCorrectTBit

5.12.1.7 DisableFlashBPs

This command disables the FlashBP feature.

Syntax

DisableFlashBPs

5.12.1.8 DisableFlashDL

This command disables the J-Link FlashDL feature.

Syntax

DisableFlashDL

5.12.1.9 DisableInfoWinFlashBPs

This command is used to disable the flash download window for the flash breakpoint feature. Enabled by default.

Syntax

DisableInfoWinFlashBPs

5.12.1.10DisableInfoWinFlashDL

This command is used to disable the flash download information window for the flash download feature. Enabled by default.

DisableInfoWinFlashDL

5.12.1.11DisableMOEHandling

The J-Link DLL outputs additional information about mode of entry (MOE) in case the target CPU halted / entered debug mode. Disabled by default.

Syntax

DisableMOEHandling

5.12.1.12DisablePowerSupplyOnClose

This command is used to ensure that the power supply for the target will be disabled on close.

Syntax

DisablePowerSupplyOnClose

5.12.1.13EnableAutoUpdateFW

This command is used to enable the automatic firmware update if a new firmware is available.

Syntax

EnableAutoUpdateFW

5.12.1.14EnableEraseAllFlashBanks

Used to enable erasing of other flash banks than the internal, like (Q)SPI flash or CFI flash.

Syntax

EnableEraseAllFlashBanks

5.12.1.15EnableFlashBPs

This command enables the FlashBP feature.

Syntax

EnableFlashBPs

5.12.1.16EnableFlashDL

This command enables the J-Link ARM FlashDL feature.

Syntax

EnableFlashDL

5.12.1.17EnableInfoWinFlashBPs

This command is used to enable the flash download window for the flash breakpoint feature. Enabled by default.

Syntax

EnableInfoWinFlashBPs

5.12.1.18EnableInfoWinFlashDL

This command is used to enable the flash download information window for the flash download feature.

-

Syntax

EnableInfoWinFlashDL

5.12.1.19EnableMOEHandling

The J-Link DLL outputs additional information about mode of entry (MOE) in case the target CPU halted / entered debug mode. Disabled by default.

Additional information is output via log-callback set with

JLINK_OpenEx(JLINK_LOG* pfLog, JLINK_LOG* pfErrorOut)

Syntax

EnableMOEHandling

5.12.1.20EnableRemarks

The J-link DLL provides more detailed output during CPU-detection / connection process. Kind of "verbose" option. Disabled by default, therefor only an enable option. Will be reset to "disabled" on each call to JLINK_Open() (reconnect to J-Link).

Syntax

EnableRemarks

5.12.1.21ExcludeFlashCacheRange

This command is used to invalidate flash ranges in flash cache, that are configured to be excluded from the cache.

Example

ExcludeFlashCacheRange 0x1000000-0x100FFFFF

5.12.1.22GetCPUVars

5.12.1.23 Hide device selection

This command can be used to suppress the device selection dialog. If enabled, the device selection dialog will not be shown in case an unknown device is selected.

Syntax

```
HideDeviceSelection = 0 \mid 1
```

Example

HideDeviceSelection 1 // Device selection will not show up

5.12.1.24HSSLogFile

This command enables HSS-Logging. Separate to the application using HSS, all HSS Data will be stored in the specified file.

Syntax

HSSLogFile = <Path>

Example

HSSLogFile = C:\Test.log

5.12.1.25InvalidateCache

This command is used to invalidate cache.

Syntax

InvalidateCache

5.12.1.26InvalidateFW

This command is used to invalidate the current firmware of the J-Link / J-Trace. Invalidating the firmware will force a firmware update. Can be used for downdating. For more information please refer to *J*-Link / *J*-Trace firmware on page 426.

Syntax

InvalidateFW

5.12.1.27map exclude

This command excludes a specified memory region from all memory accesses. All subsequent memory accesses to this memory region are ignored.

Memory mapping

Some devices do not allow access of the entire 4GB memory area. Ideally, the entire memory can be accessed; if a memory access fails, the CPU reports this by switching to abort mode. The CPU memory interface allows halting the CPU via a WAIT signal. On some devices, the WAIT signal stays active when accessing certain unused memory areas. This halts the CPU indefinitely (until RESET) and will therefore end the debug session. This is exactly what happens when accessing critical memory areas. Critical memory areas should not be present in a device; they are typically a hardware design problem. Nevertheless, critical memory areas exist on some devices.

To avoid stalling the debug session, a critical memory area can be excluded from access: J-Link will not try to read or write to critical memory areas and instead ignore the access silently. Some debuggers (such as IAR C-SPY) can try to access memory in such areas by dereferencing non-initialized pointers even if the debugged program (the debuggee) is working perfectly. In situations like this, defining critical memory areas is a good solution.

Syntax

map exclude <SAddr>-<EAddr>

Example

This is an example for the ${\tt map}$ ${\tt exclude}$ command in combination with an NXP LPC2148 MCU.

Memory map

0x00000000-0x0007FFFF	On-chip flash memory
0x00080000-0x3FFFFFFF	Reserved
0x40000000-0x40007FFF	On-chip SRAM
0x40008000-0x7FCFFFFF	Reserved
0x7FD00000-0x7FD01FFF	On-chip USB DMA RAM
0x7FD02000-0x7FD02000	Reserved
0x7FFFD000-0x7FFFFFFF	Boot block (remapped from on-chip flash memory)
0x80000000-0xDFFFFFFF	Reserved
0xE0000000-0xEFFFFFFF	VPB peripherals
0xF0000000-0xFFFFFFFF	AHB peripherals

The "problematic" memory areas are:

0x00080000-0x3FFFFFFF

Reserved

0x40008000-0x7FCFFFFF	Reserved
0x7FD02000-0x7FD02000	Reserved
0x80000000-0xDFFFFFFF	Reserved

To exclude these areas from being accessed through J-Link the $\tt map \ exclude \ command \ should \ be used as follows:$

map exclude 0x00080000-0x3FFFFFFF
map exclude 0x40008000-0x7FCFFFFF
map exclude 0x7FD02000-0x7FD02000
map exclude 0x8000000-0xDFFFFFFFF

5.12.1.28map illegal

This command marks a specified memory region as an illegal memory area. All subsequent memory accesses to this memory region produces a warning message and the memory access is ignored. This command can be used to mark more than one memory region as an illegal area by subsequent calls.

Syntax

Map Illegal <SAddr>-<EAddr>

Example

Map Illegal 0xF000000-0xFFDFFFF

Additional information

• SAddr has to be a 256-byte aligned address.

The region size has to be a multiple of 256 bytes.

5.12.1.29map indirectread

This command can be used to read a memory area indirectly. Indirect reading means that a small code snippet is downloaded into RAM of the target device, which reads and transfers the data of the specified memory area to the host. Before map indirectread can be called a RAM area for the indirect read code snippet has to be defined. Use therefor the map ram command and define a RAM area with a size of >= 256 byte.

Typical applications

Refer to chapter Fast GPIO bug on page 382 for an example.

Syntax

map indirectread <StartAddressOfArea>-<EndAddress>

Example

map indirectread 0x3fffc000-0x3fffcfff

Additional information

• StartAddressOfArea has to be a 256-byte aligned address.

The region size has to be a multiple of 256 bytes.

5.12.1.30map ram

This command should be used to define an area in RAM of the target device. The area must be 256-byte aligned. The data which was located in the defined area will not be corrupted. Data which resides in the defined RAM area is saved and will be restored if necessary. This command has to be executed before map indirectread will be called.

Typical applications

Refer to chapter Fast GPIO bug on page 382 for an example.

Syntax

map ram <StartAddressOfArea>-<EndAddressOfArea>

Example

map ram 0x4000000-0x40003fff;

Additional information

• StartAddressOfArea has to be a 256-byte aligned address.

The region size has to be a multiple of 256 bytes.

5.12.1.31 map region

This command is used to specify memory areas with various region types.

Syntax

map region <StartAddressOfArea>-<EndAddressOfArea> <RegionType>

Region type	Description
N	Normal
С	Cacheable
Х	Excluded
XI	Excluded & Illegal
Ι	Indirect access
A	Alias (static, e.g. RAM/flash that is aliased multiple times in one area. Does not change during the debug session.)
AD	Alias (dynamic, e.g. memory areas where different memo- ries can be mapped to.)

Example

map region 0x100000-0x1FFFFF C

5.12.1.32map reset

This command restores the default memory mapping, which means all memory accesses are permitted.

Typical applications

Used with other "map" commands to return to the default values. The map reset command should be called before any other "map" command is called.

Syntax

map reset

Example

map reset

5.12.1.33ProjectFile

This command is used to specify a file used by the J-Link DLL to save the current configuration.

Using this command is recommended if settings need to be saved. This is typically the case if Flash breakpoints are enabled and used. It is recommended that an IDE

uses this command to allow the JLinkARM.dll to store its settings in the same directory as the project and settings file of the IDE. The recommended extension for project files is *.jlink.

Assuming the Project is saved under C:\Work\Work and the project contains to targets name Debug and Release, the debug version could set the file name

C:\Work\Debug.jlink.

The release version could use

C:\Work\Release.jlink.

Note

Spaces in the filename are permitted.

Syntax

```
ProjectFile = <FullFileName>
```

Example

ProjectFile = C:\Work\Release.jlink

5.12.1.34ScriptFile

This command is used to set the path to a J-Link script file which shall be executed. J-Link scriptfiles are mainly used to connect to targets which need a special connection sequence before communication with the core is possible.

Syntax

```
ScriptFile = <FullFileName>
```

Example

```
ScriptFile = C:\Work\Default.JLinkScript
```

5.12.1.35SelectTraceSource

This command selects the trace source which shall be used for tracing.

Syntax

```
SelectTraceSource = <SourceNumber>
```

Trace source number	Description
0	ETB
1	ETM

Example

SelectTraceSource = 0 // Select ETB

5.12.1.36SetAllowFlashCache

This command is used to enable / disable caching of flash contents. Enabled by default.

Syntax

SetAllowFlashCache = $0 \mid 1$

Example

SetAllowFlashCache = 1 // Enables flash cache

5.12.1.37 SetAllowSimulation

This command can be used to enable or disable the instruction set simulation. By default the instruction set simulation is enabled.

Syntax

```
SetAllowSimulation = 0 \mid 1
```

Example

SetAllowSimulation 1 // Enables instruction set simulation

5.12.1.38SetBatchMode

This command is used to tell the J-Link DLL that it is used in batch-mode / automatized mode, so some dialogs etc. will automatically close after a given timeout. Disabled by default.

Syntax

```
SetBatchMode = 0 \mid 1
```

Example

SetBatchMode 1 // Enables batch mode

5.12.1.39SetCFIFlash

This command can be used to set a memory area for CFI compliant flashes.

Syntax

SetCFIFlash <StartAddressOfArea>-<EndAddressOfArea>

Example

SetCFIFlash 0x1000000-0x100FFFFF

5.12.1.40 SetCheckModeAfterRead

This command is used to enable or disable the verification of the CPSR (current processor status register) after each read operation. By default this check is enabled. However this can cause problems with some CPUs (e.g. if invalid CPSR values are returned). Please note that if this check is turned off (SetCheckModeAfterRead = 0), the success of read operations cannot be verified anymore and possible data aborts are not recognized.

Typical applications

This verification of the CPSR can cause problems with some CPUs (e.g. if invalid CPSR values are returned). Note that if this check is turned off (SetCheckModeAfterRead = 0), the success of read operations cannot be verified anymore and possible data aborts are not recognized.

Syntax

```
SetCheckModeAfterRead = 0 | 1
```

Example

SetCheckModeAfterRead = 0

5.12.1.41SetCompareMode

This command is used to configure the compare mode.

Syntax

SetCompareMode = <Mode>

Compare mode	Description
0	Skip
1	Using fastest method (default)
2	Using CRC
3	Using readback

Example

SetCompareMode = 1 // Select using fastest method

5.12.1.42SetCPUConnectIDCODE

Used to specify an IDCODE that is used by J-Link to authenticate itself when connecting to a specific device. Some devices allow the user to lock out a debugger by default, until a specific unlock code is provided that allows further debugging. This function allows to automate this process, if J-Link is used in a production environment.

The IDCODE stream is expected as a hex-encoded byte stream. If the CPU e.g. works on a word-basis for the IDCODE, this stream is interpreted as a little endian formatted stream where the J-Link library then loads the words from and passes them to the device during connect.

Syntax

SetCPUConnectIDCODE = <IDCODE_Stream>

Example

CPU has a 64-bit IDCODE (on word-basis) and expects 0x11223344 0x55667788 as IDCODE.

SetCPUConnectIDCODE = 4433221188776655

5.12.1.43SetDbgPowerDownOnClose

When using this command, the debug unit of the target CPU is powered-down when the debug session is closed.

Note: This command works only for Cortex-M3 devices

Typical applications

This feature is useful to reduce the power consumption of the CPU when no debug session is active.

Syntax

SetDbgPowerDownOnClose = <value>

Example

```
SetDbgPowerDownOnClose = 1 // Enables debug power-down on close.
SetDbgPowerDownOnClose = 0 // Disables debug power-down on close.
```

5.12.1.44SetETBIsPresent

This command is used to select if the connected device has an ETB.

Syntax

SetETBIsPresent = 0 | 1

```
SetETBLSPresent = 1 // ETB is available
SetETBLSPresent = 0 // ETB is not available
```

5.12.1.45SetETMIsPresent

This command is used to select if the connected device has an ETM.

Syntax

SetETMIsPresent = 0 | 1

Example

```
SetETMIsPresent = 1 // ETM is available
SetETMIsPresent = 0 // ETM is not available
```

5.12.1.46SetFlashDLNoRMWThreshold

This command sets the J-Link DLL internal threshold when a write to flash memory does not cause a read-modify-write (RMW) operation. For example, when setting this value to 0x800, all writes of amounts of data < 2 KB will cause the DLL to perform a read-modify-write operation on incomplete sectors.

Default: Writing amounts of < 1 KB (0x400) to flash causes J-Link to perform a read-modify-write on the flash.

Example 1 with default config: Flash has 2 * 1 KB sectors Debugger writes 512 bytes J-Link will perform a read-modify-write on the first sector, preserving contents of 512 -1023 bytes. Second sector is left untouched.

Example 2 with default config: Flash has 2 * 1 KB sectors Debugger writes 1280 bytes J-Link will erase + program 1 KB of first sector. J-Link will erase + program 256 bytes of second sector. Previous 768 bytes from second sector are lost.

The default makes sense for flash programming where old contents in remaining space of affected sectors are usually not needed anymore. Writes of < 1 KB usually mean that the user is performing flash manipulation from within a memory window in a debugger to manipulate the application behavior during runtime (e.g. by writing some constant data used by the application). In such cases, it is important to preserve the remaining data in the sector to allow the application to further work correctly.

Syntax

SetFlashDLNoRMWThreshold = <value>

Example

SetFlashDLNoRMWThreshold = 0x100 // 256 Bytes

5.12.1.47SetFlashDLThreshold

This command is used to set a minimum amount of data to be downloaded by the flash download feature.

Syntax

SetFlashDLThreshold = <value>

SetFlashDLThreshold = 0x100 // 256 Bytes

5.12.1.48SetIgnoreReadMemErrors

This command can be used to ignore read memory errors. Disabled by default.

Syntax

SetIgnoreReadMemErrors = 0 | 1

Example

SetIgnoreReadMemErrors = 1 // Read memory errors will be ignored SetIgnoreReadMemErrors = 0 // Read memory errors will be reported

5.12.1.49SetIgnoreWriteMemErrors

This command can be used to ignore read memory errors. Disabled by default.

Syntax

```
SetIgnoreWriteMemErrors = 0 | 1
```

Example

SetIgnoreWriteMemErrors = 1 // Write memory errors will be ignored SetIgnoreWriteMemErrors = 0 // Write memory errors will be reported

5.12.1.50SetMonModeDebug

This command is used to enable / disable monitor mode debugging. Disabled by default.

Syntax

SetMonModeDebug = 0 | 1

Example

SetMonModeDebug = 1 // Monitor mode debugging is enabled SetMonModeDebug = 0 // Monitor mode debugging is disabled

5.12.1.51 SetResetPulseLen

This command defines the length of the RESET pulse in milliseconds. The default for the RESET pulse length is 20 milliseconds.

Syntax

SetResetPulseLen = <value>

Example

SetResetPulseLen = 50

5.12.1.52 SetResetType

This command selects the reset strategy which shall be used by J-Link, to reset the device. The value which is used for this command is analog to the reset type which shall be selected. For a list of all reset types which are available, please refer to *Reset strategies* on page 199. Please note that there different reset strategies for ARM 7/9 and Cortex-M devices.

Syntax

SetResetType = <value>

SetResetType = 0 // Selects reset strategy type 0: normal

5.12.1.53 SetRestartOnClose

This command specifies whether the J-Link restarts target execution on close. The default is to restart target execution. This can be disabled by using this command.

Syntax

SetRestartOnClose = $0 \mid 1$

Example

SetRestartOnClose = 1

5.12.1.54 SetRTTAddr

In some cases J-Link cannot locate the RTT buffer in known RAM. This command is used to set the exact address manually.

Syntax

SetRTTAddr <RangeStart>

Example

SetRTTAddr 0x2000000

5.12.1.55 SetRTTTelnetPort

This command alters the RTT telnet port. Default is 19021. This command must be called before a connection to a J-Link is established. In J-Link Commander, command strings ("exec <CommandString>") can only be executed after a connection to J-Link is established, therefore this command string has no effect in J-Link Commander. The -RTTTelnetPort command line parameter can be used instead .

Syntax

SetRTTTelnetPort <value>

Example

SetRTTTelnetPort 9100

5.12.1.56SetRTTSearchRanges

In some cases J-Link cannot locate the RTT buffer in known RAM. This command is used to set (multiple) ranges to be searched for the RTT buffer.

Syntax

```
SetRTTSearchRanges <RangeAddr> <RangeSize> [, <RangeAddr1> <RangeSize1>, ..]
```

Example

SetRTTSearchRanges 0x10000000 0x1000, 0x20000000 0x1000,

5.12.1.57SetRXIDCode

This command is used to set the ID Code for Renesas RX devices to be used by the J-Link DLL.

Syntax

```
SetRXIDCode = <RXIDCode_String>
```

238

Example Set 16 IDCode Bytes (32 Characters).

SetRXIDCode = 112233445566778899AABBCCDDEEFF00

5.12.1.58SetSkipProgOnCRCMatch

Note: Deprecated. Use SetCompareMode instead.

This command is used to configure the CRC match / compare mode.

Syntax

SetSkipProgOnCRCMatch = <CompareMode>

Compare mode	Description
0	Skip
1	Using fastest method (default)
2	Using CRC
3	Using readback

Example

SetSkipProgOnCRCMatch = 1 // Select using fastest method

5.12.1.59 SetSysPowerDownOnIdle

When using this command, the target CPU is powered-down when no transmission between J-Link and the target CPU was performed for a specific time. When the next command is given, the CPU is powered-up.

Note: This command works only for Cortex-M3 devices.

Typical applications

This feature is useful to reduce the power consumption of the CPU.

Syntax

```
SetSysPowerDownOnIdle = <value>
```

Note: A 0 for <value> disables the power-down on idle functionality.

Example

5.12.1.60SetVerifyDownload

This command is used to configure the verify mode.

Syntax

```
SetVerifyDownload = <VerifyMode>
```

Verify mode	Description
0	Skip
1	Programmed sectors, fastest method (default)
2	Programmed sectors using CRC
3	Programmed sectors using readback
4	All sectors using fastest method
5	All sectors using CRC

Verify mode	Description
6	All sectors using read back
7	Programmed sectors using checksum
8	All sectors using checksum

SetVerifyDownload = 1 // Select programmed sectors, fastest method

5.12.1.61SetWorkRAM

This command can be used to configure the RAM area which will be used by J-Link.

Syntax

SetWorkRAM <StartAddressOfArea>-<EndAddressOfArea>

Example

SetWorkRAM 0x1000000-0x100FFFFF

5.12.1.62ShowControlPanel

Executing this command opens the control panel.

Syntax

ShowControlPanel

5.12.1.63SilentUpdateFW

After using this command, new firmware will be updated automatically without opening a message box.

Syntax

SilentUpdateFW

5.12.1.64 SupplyPower

This command activates power supply over pin 19 of the JTAG connector. The KS (Kickstart) versions of J-Link have the V5 supply over pin 19 activated by default.

Typical applications

This feature is useful for some eval boards that can be powered over the JTAG connector.

Syntax

SupplyPower = $0 \mid 1$

Example

SupplyPower = 1

5.12.1.65 SupplyPowerDefault

This command activates power supply over pin 19 of the JTAG connector permanently. The KS (Kickstart) versions of J-Link have the V5 supply over pin 19 activated by default.

Typical applications

This feature is useful for some eval boards that can be powered over the JTAG connector.

Syntax

SupplyPowerDefault = 0 | 1

Example

SupplyPowerDefault = 1

5.12.1.66SuppressControlPanel

Using this command ensures, that the control panel will not pop up automatically.

Syntax

SuppressControlPanel

5.12.1.67SuppressInfoUpdateFW

After using this command information about available firmware updates will be suppressed.

Note: We strongly recommend not to use this command, latest firmware versions should always be used!

Syntax

SuppressInfoUpdateFW

5.12.1.68SWOSetConversionMode

This command is used to set the SWO conversion mode.

Syntax

SWOSetConversionMode = <ConversionMode>

Conversion mode	Description
0	If only '\n' is received, make it "\r\n" to make the line end Windows-compliant. (Default behavior)
1	Leave everything as it is, do not add any characters.

Example

SWOSetConversionMode = 0

5.12.2 Using command strings

5.12.2.1 J-Link Commander

The J-Link command strings can be tested with the J-Link Commander. Use the command $_{\rm exec}$ supplemented by one of the command strings.

Example

```
exec SupplyPower = 1
exec map reset
exec map exclude 0x1000000-0x3FFFFFFF
```

5.12.2.2 IAR Embedded Workbench

The J-Link command strings can be supplied using the C-SPY debugger of the IAR Embedded Workbench. Open the **Project options** dialog box and select **Debugger**.

Options for node "Proj	ect"	×

5.13 Switching off CPU clock during debug

We recommend not to switch off CPU clock during debug. However, if you do, you should consider the following:

Non-synthesizable cores (ARM7TDMI, ARM9TDMI, ARM920, etc.)

With these cores, the TAP controller uses the clock signal provided by the emulator, which means the TAP controller and ICE-Breaker continue to be accessible even if the CPU has no clock.

Therefore, switching off CPU clock during debug is normally possible if the CPU clock is periodically (typically using a regular timer interrupt) switched on every few ms for at least a few us. In this case, the CPU will stop at the first instruction in the ISR (typically at address 0x18).

Synthesizable cores (ARM7TDMI-S, ARM9E-S, etc.)

With these cores, the clock input of the TAP controller is connected to the output of a three-stage synchronizer, which is fed by clock signal provided by the emulator, which means that the TAP controller and ICE-Breaker are not accessible if the CPU has no clock.

If the RTCK signal is provided, adaptive clocking function can be used to synchronize the JTAG clock (provided by the emulator) to the processor clock. This way, the JTAG clock is stopped if the CPU clock is switched off.

If adaptive clocking is used, switching off CPU clock during debug is normally possible if the CPU clock is periodically (typically using a regular timer interrupt) switched on every few ms for at least a few us. In this case, the CPU will stop at the first instruction in the ISR (typically at address 0x18).

5.14 Cache handling

Most target systems with external memory have at least one cache. Typically, ARM7 systems with external memory come with a unified cache, which is used for both code and data. Most ARM9 systems with external memory come with separate caches for the instruction bus (I-Cache) and data bus (D-Cache) due to the hardware architecture.

5.14.1 Cache coherency

When debugging or otherwise working with a system with processor with cache, it is important to maintain the cache(s) and main memory coherent. This is easy in systems with a unified cache and becomes increasingly difficult in systems with hardware architecture. A write buffer and a D-Cache configured in write-back mode can further complicate the problem.

ARM9 chips have no hardware to keep the caches coherent, so that this is the responsibility of the software.

5.14.2 Cache clean area

J-Link / J-Trace handles cache cleaning directly through JTAG commands. Unlike other emulators, it does not have to download code to the target system. This makes setting up J-Link / J-Trace easier. Therefore, a cache clean area is not required.

5.14.3 Cache handling of ARM7 cores

Because ARM7 cores have a unified cache, there is no need to handle the caches during debug.

5.14.4 Cache handling of ARM9 cores

ARM9 cores with cache require J-Link / J-Trace to handle the caches during debug. If the processor enters debug state with caches enabled, J-Link / J-Trace does the following:

When entering debug state

J-Link / J-Trace performs the following:

- It stores the current write behavior for the D-Cache.
- It selects write-through behavior for the D-Cache.

When leaving debug state

J-Link / J-Trace performs the following:

- It restores the stored write behavior for the D-Cache.
- It invalidates the D-Cache.

Note: The implementation of the cache handling is different for different cores. However, the cache is handled correctly for all supported ARM9 cores.

5.15 Virtual COM Port (VCOM)

5.15.1 Configuring Virtual COM Port

In general, the VCOM feature can be disabled and enabled for debug probes which comes with support for it via J-Link Commander and J-Link Configurator. Below, a small description of how to use use them to configure the feature is given.

Note: VCOM can only be used when debugging via SWD target interface. Pin 5 = J-Link-Tx (out), Pin 17 = J-Link-Rx (in).

Note: Currently, only J-Link models with hardware version 9 or newer comes with VCOM capabilites.

5.15.1.1 Via J-Link Configurator

The J-Link software and documentation package comes with a free GUI-based utility called J-Link Configurator which auto-detects all J-Links that are connected to the host PC via USB & Ethernet. The J-Link Configurator allows the user to enable and disable the VCOM. For more information about the J-Link Configurator, please refer to *J-Link Configurator* on page 167.

Configure J-Link

Product SEGGER J-Link ARM V9.00	
SN 59200006	
Nickname	
USB Identification Real SN T Real SN 59200006	
 ✓ Virtual COM-Port Note: The new configuration applies after power cycling the debug probe. 	
OK Cancel	

5.15.1.2 Via J-Link Commander

Simply start J-Link Commander, which is part of the J-Link software and documentation package and enter the vcom enable|disable command as in the screenshot below. After changing the configuration a power on cycle of the debug probe is necessary in order to use the new configuration. For feature information about how to use the J-Link Commander, please refer to *J-Link Commander (Command line tool)* on page 83.

Chapter 6 Flash download

This chapter describes how the flash download feature of the DLL can be used in different debugger environments.

6.1 Introduction

The J-Link DLL comes with a lot of flash loaders that allow direct programming of internal flash memory for popular microcontrollers. Moreover, the J-Link DLL also allows programming of CFI-compliant external NOR flash memory. The flash download feature of the J-Link DLL does not require an extra license and can be used free of charge.

Why should I use the J-Link flash download feature?

Being able to download code directly into flash from the debugger or integrated IDE significantly shortens the turn-around times when testing software. The flash download feature of J-Link is very efficient and allows fast flash programming. For example, if a debugger splits the download image into several pieces, the flash download software will collect the individual parts and perform the actual flash programming right before program execution. This avoids repeated flash programming. Moreover, the J-Link flash loaders make flash behave like RAM. This means that the debugger only needs to select the correct device which enables the J-Link DLL to automatically activate the correct flash loader if the debugger writes to a specific memory address.

This also makes it very easy for debugger vendors to make use of the flash download feature because almost no extra work is necessary on the debugger side since the debugger does not have to differ between memory writes to RAM and memory writes to flash.

6.2 Licensing

No extra license required. The flash download feature can be used free of charge.

6.3 Supported devices

J-Link supports download into the internal flash of a large number of microcontrollers. You can always find the latest list of supported devices on our website:

http://www.segger.com/jlink_supported_devices.html

In general, J-Link can be used with any ARM7/9/11, Cortex-M0/M1/M3/M4 and Cortex-A5/A8/R4 core even if it does not provide internal flash.

Furthermore, flash download is also available for all CFI-compliant external NOR-flash devices.

6.4 Setup for various debuggers (internal flash)

The J-Link flash download feature can be used by different debuggers, such as IAR Embedded Workbench, Keil MDK, GDB based IDEs, ... For different debuggers there are different steps required to enable J-Link flash download. In this section, the setup for different debuggers is explained.

6.4.1 IAR Embedded Workbench

Using the J-Link flash download feature in IAR EWARM is quite simple:

First, choose the right device in the project settings if not already done. The device settings can be found at **Project->Options->General Options->Target**.

Options for node "at91 Category: General Options C/C++ Compiler Assembler Output Converter Custom Build Build Actions Linker Debugger Simulator Angel GDB Server IAR ROM-monitor	Target Output Library Configuration Library Options MISRA-C Processor variant Core ARM7TDMI Image: Core ARM7TDMI © Device Atmel at91sam7s256 Image: Core Employee Endian mode FPU
GDB Server IAR ROM-monitor	Endian mode EPU
J-Link/J-Trace LMI FTDI Macraigor	C Little None
RDI Third-Party Driver	© BE <u>32</u> © BE <u>8</u>

To use the J-Link flash loaders, the IAR flash loader has to be disabled. To disable the IAR flash loader, the checkbox **Use flash loader(s)** at **Project->Options->Debug-ger->Download** has to be disabled, as shown below.

Category: General Options C/C++ Compiler Assembler		Factory Settings
Output Converter Custom Build Build Actions Linker Debugger Simulator Angel GDB Server IAR ROM-monitor J-Link/J-Trace LMI FTDI Macraigor RDI Third-Party Driver	Setup Download Extra Options Plugins Attach to program Merify download Suppress download Use flash loader(s)	Edit

6.4.2 Keil MDK

To use the J-Link flash download feature in Keil MDK, the following steps need to be performed:

First, choose the device in the project settings if not already done. The device settings can be found at **Project->Options for Target->Device**.

🖞 Options for Target 'MCBSTM32E Flash' 📉 🗶
Device Target Output Listing User C/C++ Asm Linker Debug Utilities
Database: Generic CPU Data Base
Vendor: STMicroelectronics
Device: STM32F103ZE
Toolset: ARM
□□ STM32F103VF ▲ □□ STM32F103VG ▲ □□ STM32F103VG ■ □□ STM32F103ZC ■ □□ STM32F105R8 ■ □□ STM32F105R8 ■ □□ STM32F105R8 ■ □□ STM32F105VC ■ □□ STM32F107R8 ■ □□ STM32F107RE ■
OK Cancel Defaults Help

To enable the J-Link flash loader **J-Link / J-Trace** at **Project->Options for Tar-get->Utilities** has to be selected. It is important that "Update Target before Debugging" is unchecked since otherwise uVision tries to use its own flashloader.

🕅 Options for Target 'MCBSTM32E Flash'	×
Device Target Output Listing User C/C++ Asm Linker Debug Utilities

6.4.3 Mentor Sourcery CodeBench

To use the J-Link flash download feature in Mentor Sourcery CodeBench, the following steps need to be performed:

Current versions of Sourcery CodeBench do not pass the device name selected in CodeBench to the J-Link DLL. Therefore a device override via J-Link settings file is needed.

- Copy the J-Link settings file template from \$JLINK_INST_DIR\$\Samples\JLink\SettingsFiles\Sample.jlinksettings to the directory where the CodeBench project is located.
- Open the Sample.jlinksettings in a text editor and scroll to the [FLASH] section.
- Change the line
 - Device="UNSPECIFIED"

to the device name that shall be selected (keep the quotation marks). A list of valid device names can be found here: *http://www.segger.com/jlink_supported_devices.html* (List of known devices)

Change the line

Override = 0 **to**

- Override = 1
- Select the settings file to be used in Sourcery CodeBench:

Name: STM32F407IE_Test Debug		
Main 🕪 Arguments 🖉 Environment 🎋 Debugger 🦻 Source 🗔 Common		
Debug interface 3-Link		
Board	stm32f4discovery Change	
	(Matches project settings)	
Debugger Options		
J-Link Startup Memory Map Advanced		
Settings File \${workspace_loc:STM32F407IE_Test}\Sample.jlinksettings Browse		
🗌 Semihostir	ig off 🔽	

Additional steps for enabling Flash Breakpoints feature

By default, Mentor Sourcery CodeBench does not allow the user to use the J-Link unlimited number of breakpoints in flash feature, since it only allows hardware breakpoints being set, by default. Enabling this feature requires an additional tweak in the J-Link settings file:

- Make sure that all steps from *Mentor Sourcery CodeBench* on page 254, to enable flash download, have been performed.
- Make sure that Sourcery CodeBench uses a J-Link DLL with version V4.85d or later. If an earlier version is used, this tweak does not work. To update the DLL used by CodeBench, copy the J-Link DLL from the J-Link installation directory to:
- C:\Tool\C\Mentor\CodeBench\bin\arm-none-eabi-jlinkarm.dll
- Open the settings file in a text editor and scroll to the [BREAKPOINTS] section.
 Add the line:
- ForceImpTypeAny = 1
- Make sure that CodeBench uses the settings file.

6.4.4 J-Link GDB Server

The configuration for the J-Link GDB Server is done by the <code>.gdbinit</code> file. The following command has to be added to the <code>.gdbinit</code> file to enable the J-Link flash download feature:

monitor flash device <DeviceName>

<DeviceName> is the name of the device for which download into internal flash memory shall be enabled. For a list of supported devices, please refer to Supported devices on page 250. For more information about the GDB monitor commands please refer to J-Link GDB Server on page 104.

6.4.5 J-Link Commander

J-Link Commander supports downloading bin files into internal flash memory of popular microcontrollers. In the following, it is explained which steps are necessary to prepare J-Link Commander for download into internal flash memory.

6.4.5.1 Preparing J-Link Commander for flash download

To configure J-Link Commander for flash download simply select the connected device by typing in the following command:

exec device = <DeviceName>

<DeviceName> is the name of the device for which download into internal flash memory shall be enabled. For a list of supported devices, please refer to Supported devices on page 250. In order to start downloading the binary data file into flash, please type in the following command:

loadfile <filename>, <addr>

<Filename> is the path of the binary data file which should be downloaded into the flash.

The loadfile command supports .bin, .hex, .mot and .srec files

<Addr> is the start address, the data file should be written to.

For more information about the J-Link RDI configuration dialog please refer to UM08004, J-Link RDI User Guide, chapter Configuration dialog.

6.5 Setup for various debuggers (CFI flash)

The setup for download into CFI-compliant memory is different from the one for internal flash. Initialization of the external memory interface the CFI flash is connected to, is user's responsibility and is expected by the J-Link software to be done prior to performing accesses to the specified CFI area. In this section, the setup for different debuggers is explained.

6.5.1 IAR Embedded Workbench / Keil MDK

Using the J-Link flash download feature with IAR Embedded Workbench / Keil MDK is quite simple:

First, start the debug session and open the J-Link Control Panel. In the tab "Settings" you will find the location of the settings file.

🛃 SEGGER J-Link ¥4.15r (beta) - Control panel		
General Settings Breakpoints Log NET	CPU Regs Target Power SWV Device Emu	
Log file C:VLink.log	Verride Clear	
Settings file C:\Program Files\SEGGER\JLinkARM_V415r\Defa	ault.ini Override	
Script file Not specified

[GENERAL]	
WorkRAMSize = 0x4000	
workRAMAddr = 0x200000 [Swo]	
SWOLOgFile=""	
Process, rice	*

Save the settings file and restart the debug session.

6.5.2 J-Link GDB Server

The configuration for the J-Link GDB Server is done by the <code>.gdbinit</code> file. The following commands have to be added to the <code>.gdbinit</code> file to enable the flash download feature:

```
monitor WorkRAM = <SAddr>-<EAddr>
monitor flash CFI = <SAddr>-<EAddr>
```

For more information about the GDB monitor commands please refer to *J*-*Link GDB* Server on page 104.

6.5.3 J-Link commander

J-Link Commander supports downloading bin files into external CFI flash memory. In the following, it is explained which steps are necessary to prepare J-Link Commander for download into external CFI flash memory based on a sample sequence for a ST STM32F103ZE device:

```
r
speed 1000
exec setcfiflash 0x64000000 - 0x64FFFFF
exec setworkram 0x20000000 - 0x2000FFFF

```

6.6 Setup for various debuggers (SPIFI flash)

The J-Link DLL supports programming of SPIFI flash and the J-Link flash download feature can be used therefor by different debuggers, such as IAR Embedded Workbench, Keil MDK, GDB based IDEs, ...

There is nothing special to be done by the user to also enable download into SPIFI flash. The setup and behavior is the same as if download into internal flash. For more information about how to setup different debuggers for downloading into SPIFI flash memory, please refer to *Setup for various debuggers (internal flash)* on page 251.

6.7 **QSPI flash support**

The J-Link DLL also supports programming of any (Q)SPI flash connected to a device that is supported by the J-Link DLL, if the device allows memory-mapped access to the flash. Most modern MCUs / CPUs provide a so called "QSPI area" in their memory-map which allows the CPU to read-access a (Q)SPI flash as regular memory (RAM, internal flash etc.).

6.7.1 Setup the DLL for QSPI flash download

There is nothing special to be done by the user to also enable download into a QSPI flash connected to a specific device. The setup and behavior is the same as if download into internal flash, which mainly means the device has to be selected and nothing else, would be performed. For more information about how to setup the J-Link DLL for download into internal flash memory, please refer to *Setup for various debuggers (internal flash)* on page 251.

The sectorization, command set and other flash parameters are fully auto-detected by the J-Link DLL, so no special user setup is required.

6.8 Using the DLL flash loaders in custom applications

The J-Link DLL flash loaders make flash behave as RAM from a user perspective, since flash programming is triggered by simply calling the J-Link API functions for memory reading / writing. For more information about how to setup the J-Link API for flash programming please refer to *UM08002 J-Link SDK* documentation (available for SDK customers only).

6.9 Debugging applications that change flash contents at runtime

The J-Link DLL cashes flash contents in order to improve overall performance and therefore provide the best debugging experience possible.

In case the debugged application does change the flash contents, it is necessary to disable caching of the effected flash range. This can be done using the J-Link command string ExcludeFlashCacheRange.

The SEGGER Wiki provides an articel about this topic that provides further information, for example how to use J-Link command strings with various IDEs.

Chapter 7 Flash breakpoints

This chapter describes how the flash breakpoints feature of the DLL can be used in different debugger environments.

7.1 Introduction

The J-Link DLL supports a feature called flash breakpoints which allows the user to set an unlimited number of breakpoints in flash memory rather than only being able to use the hardware breakpoints of the device. Usually when using hardware breakpoints only, a maximum of 2 (ARM 7/9/11) to 8 (Cortex-A/R) breakpoints can be set. The flash memory can be the internal flash memory of a supported microcontroller or external CFI-compliant flash memory. In the following sections the setup for different debuggers for use of the flash breakpoints feature is explained.

How do breakpoints work?

There are basically 2 types of breakpoints in a computer system: Hardware breakpoints and software breakpoints. Hardware breakpoints require a dedicated hardware unit for every breakpoint. In other words, the hardware dictates how many hardware breakpoints can be set simultaneously. ARM 7/9 cores have 2 breakpoint units (called "watchpoint units" in ARM's documentation), allowing 2 hardware breakpoints to be set. Hardware breakpoints do not require modification of the program code. Software breakpoints are different: The debugger modifies the program and replaces the breakpointed instruction with a special value. Additional software breakpoints do not require additional hardware units in the processor, since simply more instructions are replaced. This is a standard procedure that most debuggers are capable of, however, this usually requires the program to be located in RAM.

What is special about software breakpoints in flash?

Flash breakpoints allows setting an unlimited number of breakpoints even if the user application is not located in RAM. On modern microcontrollers this is the standard scenario because on most microcontrollers the internal RAM is not big enough to hold the complete application. When replacing instructions in flash memory this requires re-programming of the flash which takes much more time than simply replacing a instruction when debugging in RAM. The J-Link flash breakpoints feature is highly optimized for fast flash programming speed and in combination with the instruction set simulation only re-programs flash that is absolutely necessary. This makes debugging in flash using flash breakpoints almost as flawless as debugging in RAM.

What performance can I expect?

Flash algorithm, specially designed for this purpose, sets and clears flash breakpoints extremely fast; on microcontrollers with fast flash the difference between software breakpoints in RAM and flash is hardly noticeable.

How is this performance achieved?

We have put a lot of effort in making flash breakpoints really usable and convenient. Flash sectors are programmed only when necessary; this is usually the moment execution of the target program is started. A lot of times, more than one breakpoint is located in the same flash sector, which allows programming multiple breakpoints by programming just a single sector. The contents of program memory are cached, avoiding time consuming reading of the flash sectors. A smart combination of software and hardware breakpoints allows us to use hardware breakpoints a lot of times, especially when the debugger is source level-stepping, avoiding re-programming the flash in these situations. A built-in instruction set simulator further reduces the number of flash operations which need to be performed. This minimizes delays for the user, while maximizing the life time of the flash. All resources of the ARM microcontroller are available to the application program, no memory is lost for debugging.

7.2 Licensing

In order to use the flash breakpoints feature a separate license is necessary for each J-Link. For some devices J-Link comes with a device-based license and some J-Link models also come with a full license for flash breakpoints but the normal J-Link comes without any licenses. For more information about licensing itself and which devices have a device-based license, please refer to *Licensing* on page 67.

7.2.1 Free for evaluation and non-commercial use

In general, the unlimited flash breakpoints feature of the J-Link DLL can be used free of charge for evaluation and non-commercial use.

If used in a commercial project, a license needs to be purchased when the evaluation is complete. There is no time limit on the evaluation period. This feature allows setting an unlimited number of breakpoints even if the application program is located in flash memory, thereby utilizing the debugging environment to its fullest.

J-Link	V4.50i Out of breakpoints
<u>^</u>	The debugger is trying to set a breakpoint in flash memory at address 0x08000200. The target CPU has run out of hardware breakpoints. In order to set the requested breakpoint, a software breakpoint in flash memory can be set. Unlimited breakpoints in flash memory (Flash Breakpoints) is an enhanced feature of J-Link which requires an additional license. Some members of the J-Link family (such as the J-Link Pro and J-Link EDU) already come with a built-in license for unlimited breakpoints in flash memory. In order to buy a license for unlimited breakpoints in flash memory for the connected emulator, please get in touch with sales@segger.com. For more information regarding this feature, please refer to http://www.segger.com/link_buy_flashbps.html.
	However, using this feature without the additional license is possible and permitted if used for evaluation only. Evaluate unlimited breakpoints in flash memory now ?
	J-Link S/N: 58004070 6 breakpoints are currently set: #1 Add = 0x08000200, Type = Any, Implementation = Hard #2 Add = 0x08000226, Type = Any, Implementation = Hard #4 Add = 0x08000228, Type = Any, Implementation = Hard #5 Addr = 0x08000228, Type = Any, Implementation = Hard #5 Addr = 0x08000286, Type = Any, Implementation = Hard #6 Addr = 0x08000286, Type = Any, Implementation = Hard
	Yes No

7.3 Supported devices

J-Link supports flash breakpoints for a large number of microcontrollers. You can always find the latest list of supported devices on our website:

http://www.segger.com/jlink_supported_devices.html

In general, J-Link can be used with any ARM7/9/11, Cortex-M0/M1/M3/M4 and Cortex-A5/A8/R4 core even if it does not provide internal flash.

Furthermore, flash breakpoints are also available for all CFI compliant external NOR-flash devices.

7.4 Setup & compatibility with various debuggers

7.4.1 Setup

In compatible debuggers, flash breakpoints work if the J-Link flash loader works and a license for flash breakpoints is present. No additional setup is required. The flash breakpoint feature is available for internal flashes and for external flash (parallel NOR CFI flash as well as QSPI flash). For more information about how to setup various debuggers for flash download, please refer to *Setup for various debuggers (internal flash)* on page 251. Whether flash breakpoints are available can be verified using the J-Link control panel:

🛃 SEGGER J-Link ¥4.35g (beta) - Control panel	
General Settings Breakpoints Log NET CPU Regs	s Target Power SWV RAWTrace 💶

Script file Not specified	
Flash download On Compare Using fastest method On Compare Using fastest method Off Verify Programmed sectors, fastest method Enabled, download pending: 0 bytes	■ Flash breakpoints
Override device selection ✓ Allow caching of flash contents (On) ✓ Allow instruction set simulation Override memory map	
Ready JLINK_HasError (Done)	1.110 sec. in 14 calls

7.4.2 Compatibility with various debuggers

Flash breakpoints can be used in all debugger which use the proper J-Link API to set breakpoints. Compatible debuggers/ debug interfaces are:

- IAR Embedded Workbench
- Keil MDK
- GDB-based debuggers
- Freescale Codewarrior
- Mentor Graphics Sourcery CodeBench
- RDI-compliant debuggers

Incompatible debuggers / debug interfaces:

Rowley Crossworks

7.5 Flash Breakpoints in QSPI flash

Many modern CPUs allow direct execution from QSPI flash in a so-called "QSPI area" in their memory-map. This feature is called execute-in-place (XIP). On some cores like Cortex-M where hardware breakpoints are only available in a certain address range, sometimes J-Link flash breakpoints are the only possibility to set breakpoints when debugging code running in QSPI flash.

7.5.1 Setup

The setup for the debugger is the same as for downloading into QSPI flash. For more information please refer to *QSPI flash support* on page 260.

7.6 FAQ

- Q: Why can flash breakpoints not be used with Rowley Crossworks?
- A: Because Rowley Crossworks does not use the proper J-Link API to set breakpoints. Instead of using the breakpoint-API, Crossworks programs the debug hardware directly, leaving J-Link no choice to use its flash breakpoints.

Chapter 8 Monitor Mode Debugging

This chapter describes how to use monitor mode debugging support with J-Link.

8.1 Introduction

In general, there are two standard debug modes available for CPUs:

- 1. Halt mode
- 2. Monitor mode

Halt mode is the default debug mode used by J-Link. In this mode the CPU is halted and stops program execution when a breakpoint is hit or the debugger issues a halt request. This means that no parts of the application continue running while the CPU is halted (in debug mode) and peripheral interrupts can only become pending but not taken as this would require execution of the debug interrupt handlers. In circumstances halt mode may cause problems during debugging specific systems:

- 1. Certain parts of the application need to keep running in order to make sure that communication with external components does not break down. This is the case for Bluetooth applications where the Bluetooth link needs to be kept up while the CPU is in debug mode, otherwise the communication would fail and a resume or single stepping of the user application would not be possible
- 2. Some peripherals are also stopped when the CPU enters debug mode. For example; Pulse-width modulation (PWM) units for motor control applications may be halted while in an undefined / or even dangerous state, resulting in unwanted side-effects on the external hardware connected to these units.

This is where monitor mode debugging becomes effective. In monitor debug mode the CPU is not halted but takes a specific debug exception and jumps into a defined exception handler that executes (usually in a loop) a debug monitor software that performs communication with J-Link (in order to read/write CPU registers and so on). The main effect is the same as for halting mode: the user application is interrupted at a specific point but in contrast to halting mode, the fact that the CPU executes a handler also allows it to perform some specific operations on debug entry / exit or even periodically during debug mode with almost no delay. This enables the handling of such complex debug cases as those explained above.

8.2 Enable Monitor Debugging

As explained before, by default J-Link uses halt mode debugging. In order to enable monitor mode debugging, the J-Link software needs to be explicitly told to use monitor mode debugging. This is done slightly differently from IDE to IDE. In general, the IDE does not notice any difference between halting and monitor debug mode. If J-Link is unable to locate a valid monitor in the target memory, it will default back to halt mode debugging in order to still allow debugging in general.

In the following, some examples on how to enable monitor mode debugging for different IDEs are given:

8.2.1 GDB based debug solutions

For GDB based debug solutions there is a .gdbinit file which contains commands that can be executed by GDB / GDBServer. In this .gdbinit file the following line needs to be added to enable monitor mode debugging (Second command only needed in case of monitor interrupt forwarding, see *Forwarding of Monitor Interrupts* on page 279):

```
monitor exec SetMonModeDebug = 1
monitor exec SetMonModeVTableAddr = <Addr>
```

8.2.2 IAR EWARM

In IAR EWARM there are so-called macro files available to customize certain operations. In this file, the following function with the following line needs to be present (Second line only needed in case of monitor interrupt forwarding, see *Forwarding of Monitor Interrupts* on page 279):

The macro file also needs to be selected to be used in the project:

Category:	Factory Settings
General Options Static Analysis Runtime Checking C/C++ Compiler Assembler	Setup Download Images Extra Options Multicore Plugins Driver
	Devige description file Qveride default STOOLKIT_DIR\$\CONFIG\debugger\AnalogDevices\ioCM40z

8.2.3 Keil MDK-ARM (uVision)

In Keil MDK-ARM there is no built-in option to pass execs or similar to the J-Link DLL, therefore monitor mode has to be enabled on a per-project basis via the J-Link settings file that is created on start of the first dbeug session with a specific project. for more information where to find the J-Link settings file for a Keil MDK-ARM project, please refer to *The J-Link settings file* on page 205.

To enable monitor mode debugging, the following lines have to be added to the settings file (opened in a text editor), in the [CPU] section (Second line only needed in case of monitor interrupt forwarding, see *Forwarding of Monitor Interrupts* on page 279):

```
[CPU]
MonModeDebug=1
MonModeVTableAddr=<Addr>
```

8.2.4 J-Link Commander

In J-Link Commander, the appropriate command to enable monitor mode can be executed directly (Second command only needed in case of monitor interrupt forwarding, see *Forwarding of Monitor Interrupts* on page 279):

```
J-Link>exec SetMonModeDebug = 1
J-Link>exec SetMonModeVTableAddr = <Addr>
```

8.2.5 Generic way of enabling

exec SetMonModeDebug=1

There is always the possibility to perform the monitor mode enable command manually via the J-Link control panel. This works independently from the IDE. For more information about the J-Link control panel, please refer to *J-Link control panel* on page 193 (Second command only needed in case of monitor interrupt forwarding, see *Forwarding of Monitor Interrupts* on page 279):

```
exec SetMonModeVTableAddr=<Addr>
 J-Link V5.01h (beta) - Control panel
                                                                        - • •
   General Settings Breakpoints RTT Log CPU Regs Target Power SWV RAWTrace
                                 Start minimized
                                 🔽 Always on top
                                 Process C:\Tool\C\IAR\ARM_V7402\common\bin\IarldePm.exe
                                   DLL C:\Tool\C\IAR\ARM_V7402\arm\bin\JLinkARM.dll
                                  J-Link SEGGER J-Link ARM V9.2, SN=59200000
                                 Device CM40Z_384_2048 (compatible to Little endian 3.33 V
                                Target interface JTAG 4000 kHz 👻 Actual 4000 kHz
                                 Host interface USB (Port 0)
                                                           License
                                                                       About
    exec SetMonModeDebug = 1
 Ready
                JLINK_ReadMemU32 (Done)
                                                            1.295 sec. in 419 calls
```

8.3 Availability and limitations of monitor mode

Many CPUs only support one of these debug modes, halt mode or monitor mode. In the following it is explained for which CPU cores monitor mode is available and any limitations, if any.

8.3.1 Cortex-M3

See Cortex-M4 on page 275.

8.3.2 Cortex-M4

For Cortex-M4, monitor mode debugging is supported. The monitor code provided by SEGGER can easily be linked into the user application.

Considerations & Limitations

- The user-specific monitor functions must not block the generic monitor for more than 100ms.
- Manipulation of the stackpointer register (SP) from within the IDE is not possible as the stackpointer is necessary for resuming the user application on Go().
- The unlimited number of flash breakpoints feature cannot be used in monitor mode. This restriction may be removed in a future version.
- It is not possible to debug the monitor itself, when using monitor mode.

8.4 Monitor code

A CPU core-specific monitor code is necessary to perform monitor mode debugging with J-Link. This monitor performs the communication with J-Link while the CPU is in debug mode (meaning in the monitor exception). The monitor code needs to be compiled and linked as a normal part of the application. Monitors for different cores are available from SEGGER upon request at *support_jlink@segger.com*.

In general, the monitor code consists of three files:

- JLINK_MONITOR.c: Contains user-specific functions that are called on debug mode entry, exit and periodically while the CPU is in debug mode. Functions can be filled with user-specific code. None of the functions must block the generic monitor for more than 100ms.
- JLINK_MONITOR.h: Header file to populate JLINK_MONITOR_ functions.
- JLINK_MONITOR_ISR.s: Generic monitor assembler file. (Should not be modified by the user)Do NOT touch.

8.5 Debugging interrupts

In general it is possible to debug interrupts when using monitor mode debugging but there are some things that need to be taken care of when debugging interrtups in monitor mode:

- Only interrupts with a lower priority than the debug/monitor interrupt can be debugged / stepped.
- Setting breakpoints in interrupt service routines (ISRs) with higher priority than the debug/monitor interrupt will result in malfunction because the CPU cannot take the debug interrupt when hitting the breakpoint.

8.6 Having servicing interrupts in debug mode

Under some circumstances it may be useful or even necessary to have some servicing interrupts still firing while the CPU is "halted" for the debugger (meaning it has taken the debug interrupt and is executing the monitor code). This can be for keeping motor controls active or a Bluetooth link etc. In general it is possible to have such interrupts by just assigning a higher priority to them than the debug interrupt has. Please keep in mind that there are some limitations for such interrupts:

- They cannot be debugged
- No breakpoints must be set in any code used by these interrupts

8.7 Forwarding of Monitor Interrupts

In some applications, there might be an additional software layer that takes all interrupts in the first place and forwards them to the user application by explicitly calling the ISRs from the user application vector table. For such cases, it is impossible for J-Link to automatically check for the existence of a monitor mode handler as the handler is usually linked in the user application and not in the additional software layer, so the DLL will automatically switch back to halt mode debugging. In order to enable monitor mode debugging for such cases, the base address of the vector table of the user application that includes the actual monitor handler, needs to be manually specified. For more information about how to do this for various IDEs, please refer to *Enable Monitor Debugging* on page 273.

8.8 Target application performs reset (Cortex-M)

For Cortex-M based target CPUs if the target application contains some code that issues a reset (e.g. a watchdog reset), some special care needs to be taken regarding breakpoints. In general, a target reset will leave the debug logic of the CPU untouched meaning that breakpoints etc. are left intact, however monitior mode gets disabled (bits in DEMCR get cleared). J-Link automatically restores the monitor bits within a few microsenconds, after they have been detected as being cleared without explicitly being cleared by J-Link.

However, there is a small window in which it can happen that a breakpoint is hit before J-Link has restored the monitor bits. If this happens, instead of entering debug mode, a HardFault is triggered. To avoid hanging of the application, a special version of the HardFault_Handler is needed which detects if the reason for the Hard-Fault was a breakpoint and if so, just ignores it and resumes execution of the target application. A sample for such a HardFault handler can be downloaded from the SEG-GER website: <u>https://www.segger.com/downloads/appnotes</u> "Generic SEGGER Hard-Fault handler".

Chapter 9 Low Power Debugging

This chapter describes how to debug low power modes on a supported target CPU.

9.1 Introduction

As power consumption is an important factor for embedded systems, CPUs provide different kinds of low power modes to reduce power consumption of the target system. The useful this is for the application, the problematic it is during debug. In general, how far debugging target applications that make use of low power modes is possible, heavily depends on the device being used as several behavior is implementation defined and differs from device to device. The following cases are the most common ones:

- 1. The device provides specific special function registers for debugging to keep some clocks running necessary for debugging, while the device is in a low power mode.
- 2. The device wakes up automatically, as soon as there is a request by the debug probe on the debug interface
- 3. The device powers off the debug interface partially, allowing the debug probe to read-access certain parts but does not allow to control the CPU.
- 4. The device powers off the debug interface completely and the debug probe loses the connection to the device (temporarily)

While cases 1-3 are the most convenient ones from the debug perspective because the low power mode is transparent to the end user, they do not provide a real-world scenario because certain things cannot be really tested if certain clocks are still active which would not be in the release configuration with no debug probe attached. In addition to that, the power consumption is significantly higher than in the release config which may cause problems on some hardware designs which are specifically designed for very low power consumption.

The last case (debug probes temporarily loses connection) usually causes the end of a debug session because the debugger would get errors on accesses like "check if CPU is halted/hit a BP". To avoid this, there is a special setting for J-Link that can be activated, to handle such cases in a better way, which is explained in the following.

9.2 Activating low power mode handling for J-Link

While usually the J-Link DLL handles communication losses as errors, there is a possibility to enable low power mode handling in the J-Link DLL, which puts the DLL into a less restrictive mode (low-power handling mode) when it comes to such loss-cases. The low-power handling mode is disabled by default to allow the DLL to react on target communication breakdowns but this behavior is not desired when debugging cases where the target is unresponsive temporarily. How the low-power mode handling mode is enabled, depends on the debug environment. In the following, the most common scenarios are described:

9.2.1 SEGGER Embedded Studio

Low-power handling mode has to be activated in the J-Link settings file. Open the J-Link settings file in a text editor and add the following line in the [CPU] section:

```
LowPowerHandlingMode = 1
```

For more information about how to locate the settings file, please refer to *The J-Link* settings file on page 205.

9.2.2 Keil MDK-ARM

Low-power handling mode has to be activated in the J-Link settings file. Open the J-Link settings file in a text editor and add the following line in the [CPU] section:

```
LowPowerHandlingMode = 1
```

For more information about how to locate the settings file, please refer to *The J-Link* settings file on page 205.

9.2.3 IAR EWARM

Low-power handling mode has to be activated in the J-Link settings file. Open the J-Link settings file in a text editor and add the following line in the [CPU] section:

```
LowPowerHandlingMode = 1
```

For more information about how to locate the settings file, please refer to *The J-Link* settings file on page 205.

9.2.4 Mentor Sourcery CodeBench for ARM

Low-power handling mode has to be activated in the J-Link settings file. Open the J-Link settings file in a text editor and add the following line in the [CPU] section:

LowPowerHandlingMode = 1

For more information about how to locate the settings file, please refer to *The J-Link settings file* on page 205.

9.2.5 GDB + GDBServer based setups (Eclipse etc.)

As no settings file is created for such setups, the low-power handling mode has to be activated from the gdbinit / .gdbinit file by adding the following command:

```
monitor exec LowPowerHandlingMode = 1
```

9.3 **Restrictions**

As the connection to the target is temporary lost while it is in low power mode, some restrictions during debug apply:

- Make sure that the IDE does not perform periodic accesses to memory while the target is in a low power mode. E.g.: Disable periodic refresh of memory windows, close live watch windows etc.
- Avoid issuing manual halt requests to the target while it is in a low power mode.
- Do not try to set breakpoints while the target already is in a low power mode. If a breakpoint in a wake-up routine shall be hit as soon as the target wakes up from low power mode, set this breakpoint before the target enters low power mode.
- Single stepping instructions that enter a low power mode (e.g. WFI/WFE on Cortex-M) is not possible/supported.
- Debugging low power modes that require a reset to wake-up can only be debugged on targets where the debug interface is not reset by such a reset. Otherwise breakpoints and other settings are lost which may result in unpredictable behavior.

J-Link does it's best to handle cases where one or more of the above restrictions is not considered but depending on how the IDE reacts to specific operations to fail, error messages may appear or the debug session will be terminated by the IDE.

Chapter 10 J-Flash SPI

This chapter describes J-Flash SPI and J-Flash SPI CL, which are seperate software (executables) which allows direct programming of SPI flashes, without any additional hardware. Both, J-Flash SPI and J-Flash SPI CL are part of the J-Link software and documentation package which is available free of charge.

This chapter assumes that you already possess working knowledge of the J-Link device.

10.1 Introduction

The following chapter introduces J-Flash SPI, highlights some of its features, and lists its requirements on host and target systems.

10.1.1 What is J-Flash SPI?

J-Flash SPI is a stand-alone flash programming software for PCs running Microsoft Windows, which allows direct programming of SPI flashes, without any additional hardware. The following Microsoft Windows versions are supported:

- Microsoft Windows 2000
- Microsoft Windows XP
- Microsoft Windows XP x64
- Microsoft Windows 2003
- Microsoft Windows 2003 x64
- Microsoft Windows Vista
- Microsoft Windows Vista x64
- Microsoft Windows 7
- Microsoft Windows 7 x64
- Windows 8
- Windows 8 x64

J-Flash SPI has an intuitive user interface and makes programming flash devices convenient. J-Flash SPI requires a J-Link or Flasher to interface to the hardware. It is able to program all kinds of SPI flashes, even if the CPU they are connected to, is not supported by J-Link / Flasher because J-Flash SPI communicates directly with the SPI flash bypassing all other components of the hardware.

10.1.2 J-Flash SPI CL (Windows, Linux, Mac)

J-Flash SPI CL is a commandline-only version of the J-Flash SPI programming tool. The command line version is included in the J-Link Software and Documentation Package for Windows, Linux and Mac (cross-platform). Except from the missing GUI, J-Flash SPI CL is identical to the normal version.

The commands, used to configure / control J-Flash SPI CL, are exactly the same as for the command line interface of the J-Flash SPI GUI version. For further information, please refer to *Command Line Interface* on page 298.

10.1.3 Features

- Directly communicates with the SPI flash via SPI protocol, no MCU in between needed.
- Programming of all kinds of SPI flashes is supported.
- Can also program SPI flashes that are connected to CPUs that are not supported by J-Link.
- Verbose logging of all communication.
- .hex, .mot, .srec, and .bin support.
- Intuitive user interface.

10.1.4 Requirements

10.1.4.1 Host

J-Flash SPI requires a PC running Microsoft Windows 2000 or Windows XP with a free USB port dedicated to a J-Link. A network connection is required only if you want to use J-Flash SPI together with J-Link Remote Server.

10.1.4.2 Target

The flash device must be an SPI flash that supports standard SPI protocols.

10.2 Licensing

The following chapter provides an overview of J-Flash SPI related licensing options.

10.2.1 Introduction

A J-Link PLUS, ULTRA+, PRO or Flasher ARM/PRO is required to use J-Flash SPI. No additional license is required / available.

10.3 Getting Started

This chapter presents an introduction to J-Flash SPI. It provides an overview of the included sample projects and describes the menu structure of J-Flash SPI in detail.

10.3.1 Setup

For J-Link setup procedure required in order to work with J-Flash SPI, please refer to chapter *Setup* on page 157

10.3.1.1 What is included?

The following table shows the contents of all subdirectories of the J-Link software and documentation pack with regard to J-Flash SPI:

Directory	Contents
	The J-Flash SPI application. Please refer to the J-Link manual for more information about the other J-Link related tools.
.\Doc	Contains the J-Flash SPI documentation and the other J- Link related manuals.

Table 10.1: J-Flash SPI directory structure

10.3.2 Using J-Flash SPI for the first time

Start J-Flash SPI from the Windows Start menu. The main window will appear, which contains a log window at the bottom and the **Project window** of a default project on the left. The application log will initially display:

- The version and time of compilation for the application.
- The version and time of compilation for the J-Link DLL.
- The location of the default project.

The Project window contains an overview of the current project settings (initially, a default project is opened).

	h SPI V4.99a (beta) - [C:\P / <u>T</u> arget <u>O</u> ptions <u>W</u> i		GER\JLink_V499a\Defaul	t.jflash *]		• 🔀
Project - Def Name Connection Interface speed Flash memory			SEG	GER		
- JLinkARM.dll V4	9a (J-Flash compiled Apr 29 .99a (DLL compiled Apr 29 2 ct file [C:\Program Files (x86	2015 16:20:17)	∖Default jflash]			
Ready						//

10.3.3 Menu structure

The main window of J-Flash SPI contains seven drop-down menus (**File**, **Edit**, **View**, **Target**, **Options**, **Window**, **Help**). Any option within these drop-down menus that is followed by a three period ellipsis (...), is an option that requires more information before proceeding.

File menu elements

Command	Description	
Open data fileOpens a data file that may be used to flash the t device. The data file must be an Intel HEX file, a M S file, or a Binary file (.hex, .mot, .srec, or .bit		
	Merges two data files (.hex, .mot, .srec, or .bin). All gaps will be filled with FF. Find below a short example of merging two data files named, File0.bin and File1.bin into File3.bin. File0.bin> Addr 0x0200 - 0x02FF	
Merge data file	File1.bin> Addr 0x1000 - 0x13FF	
nerge data me	Merge File0.bin & File1.bin 0x0200 - 0x02FF Data of File0.bin 0x0300 - 0x0FFF gap (will be filled with 0xFF if image is saved as *.bin file) 0x1000 - 0x13FF Data of File1.bin	
	Can be saved in new data file (File3.bin).	
Save data file	Saves the data file that currently has focus.	
Save data file as	Saves the data file that currently has focus using the name and location given.	
New Project	Creates a new project using the default settings.	
Open Project	Opens a project file. Note that only one project file may be open at a time. Opening a project will close any other project currently open.	
Save Project	Saves a project file.	
Save Project as	Saves a project file using the name and location given.	
Close Project	Closes a project file.	
Recent Files >	Contains a list of the most recently open data files.	
Recent Projects >	Contains a list of the most recently open project files.	
Exit	Exits the application.	

Table 10.2: File menu elements

Edit menu elements

Command	Description	
Relocate	Relocates the start of the data file to the supplied hex offset from the current start location.	
Delete range	Deletes a range of values from the data file, starting and ending at given addresses. The End address must be greater than the Start address otherwise nothing will be done.	
Eliminate blank areas	Eliminates blank regions within the data file.	
Table 10.3: Edit menu elements		

Table 10.3: Edit menu elements

View menu elements

Command	Description
Log	Opens and/or brings the log window to the active win- dow.
Project	Opens and/or brings the project window to the active window.

Table 10.4: View menu elements

Target menu elements

Command	Description		
Connect	Creates a connection through the J-Link using the config- uration options set in the Project settings of the Options drop-down menu.		
Disconnect	Disconnects a current connection that has been made through the J-Link.		
Test >	Two test functions are implemented: "Generates test data" generates data which can be used to test if the flash can be programmed correctly. The size of the gen- erated data file can be defined. "Tests up/download speed" writes data of an specified size to a defined address, reads the written data back and measures the up- and download speed.		
Erase sectors	Erases all selected flash sectors.		
Erase chip	Erases the entire chip.		
Program	Programs the chip using the currently active data file.		
Program & Verify	Programs the chip using the currently active data file and then verifies that it was written successfully.		
Auto	The Auto command performs a sequence of steps. It con- nects to the device, erases sectors and programs the chip using the currently active data file before the written data is finally verified. The range of sectors to be erased can be configured through the Flash tab of the Project settings dialog and through the Global settings dialog.		
Verify	Verifies the data found on the chip with the data file.		
Read back >	Reads back the data found on the chip and creates a new data file to store this information. There are three ways in which the data can be read back. The Selected sectors identified on the Flash tab of the Project Settings found in the Options drop-down menu may be read back. The Entire chip may be read back. A specified Range may be read back.		

Table 10.5: Target menu elements

Options menu elements

Command	Description
Project settings	Location of the project settings that are displayed in the snapshot view found in the Project window of the J-Flash SPI application. Furthermore various settings needed to locate the J-Link and pass specified commands needed for chip initialization.
Global settings	Settings that influence the general operation of J-Flash SPI.

Table 10.6: Options menu elements

Window menu elements

Command	Description
Cascade	Arranges all open windows, one above the other, with the active window at the top.
Tile Horizontal	Tiles the windows horizontally with the active window at the top.
Tile Vertical	Tiles the windows vertically with the active window at the left.

10.4 Settings

The following chapter provides an overview of the program settings. Both general and per project settings are considered.

10.4.1 Project Settings

Project settings are available from the Options menu in the main window or by using the ALT-F7 keyboard shortcut.

10.4.1.1 General Settings

This dialog is used to choose the connection to J-Link. The J-Link can either be connected over USB or via TCP/IP to the host system. Refer to the J-Link manual for more information regarding the operation of J-Link and J-Link TCP/IP Server.

Project settings	? 💌
General Interface Flash Product	ion]
i dink	J-Flash SPI is a software for J-Link. This software is capable of programming SPI flash memories. Connection to J-Link USB Device 0 Select USB SN 0 Select C ICP/IP
	OK Cancel Apply

10.4.1.1.1 USB

If this option is checked, J-Flash SPI will connect to J-Link over the USB port. You may change the device number if you want to connect more than one J-Link to your PC. The default device number is 0. For more information about how to use multiple J-Links on one PC, please see also the chapter "Working with J-Link" of the J-Link User's Guide.

10.4.1.1.2 TCP/IP

If this option is selected, J-Flash SPI will connect to J-Link via J-Link TCP/IP Server. You have to specify the hostname of the remote system running the J-Link TCP/IP Server.

10.4.1.2 Interface

This dialog is used to configure the SPI interface settings like SPI communication speed etc.

Project settings	? 💌
General Interface Flash Production	
Interface speed	
ОК	Cancel Apply

10.4.1.2.1 Interface Speed

Specifies the SPI communication speed J-Link uses to communicate with the SPI flash.

10.4.1.3 Flash Settings

This dialog is used to select and configure the parameters of the SPI flash that J-Flash SPI will connect to. Examples for flash parameters are: Sector size (Smallest erasable unit), page size (smallest programmable unit), Flash ID, etc. There is also the option to try to auto-detect the connected flash device. The latter option will prompt J-Flash SPI to try to identify the flash by its Flash ID, looking up in an internal list of known flash devices.

Project settings	? 🔀
General Interface Flash Production	(
<u>Automatically detect SPI flash</u>	Detect SPI flash

10.4.1.4 Production Settings

Project settings	? ×
General Interface Flash Production	
Enable target power	
Delay before start 20 ms	
Actions performed by "Auto"	
✓ Erase Sectors if not blank ▼	
✓ Program	
✓ Verify	
OK Cancel	Apply

Enable target power

Enables 5V target power supply via pin 19 of the emulator. Can be used for targets which can be powered through the emulator for production. Delay before start defines the delay (in ms) after enabling the target power supply and before starting to communicate with the target.

Actions performed by "Auto"

The checked options will be perforemed when auto programming a target (Target -> Auto, shortcut: F7) . The default behaviour is Compare, Erase sectors if not blank, Program and Verify. Find below a table which describes the commands:

Command	Description	
Compare	Performs a compare of the current flash content and the data to be programmed. Sectors which do already match will be skipped by Erase / Program operation. Note: If Erase is enabled and Erase type is "Chip", the compare will be skipped as after mass erase, the entire device is empty and needs to be re-programmed.	
Erase	 Performs an erase depending on the settings, selected in the drop down box: Sectors: Erases all sectors which are effected by the image to be programmed. Sectors if not blank: Erases all sectors which are both, effected by the image to be programmed and not already blank. Chip: Erase the entire chip independent of the content. 	
Program	Programs the data file.	
Verify	Verifies the programmed data by reading them back.	

Table 10.9: Actions performed by "Auto"

10.4.2 Global Settings

Global settings are available from the Options menu in the main window.

Global settings
Operation
Auto mode affects Affected sectors only
Disconnect after each operation
✓ Automatically unlock sectors if necessary
✓ Perform blank check before program
Skip blank areas on read
Logging General log level Level 2
Enable J-Link logfile C:\Program Files (x86)\SEGGER\JLink_V49
🔲 Enable J-Flash logfile
C:\Program Files (x86)\SEGGER\JLink_V49
Projects
Save Project file on close
OK Cancel

10.4.2.1 Operation

You may define the behavior of some operations such as "Auto" or "Program & Verify".

10.4.2.1.1 Disconnect after each operation

If this option is checked, connection to the target will be closed at the end of each operation.

10.4.2.1.2 Automatically unlock sectors

If this option is checked, all sectors affected by an erase or program operation will be automatically unlocked if necessary.

10.4.2.1.3 Perform blank check

If this option is checked, a blank check is performed before any program operation to examine if the affected flash sectors are completely empty. The user will be asked to erase the affected sectors if they are not empty.

10.4.2.1.4 Skip blank areas on read

If this option is checked, a blank check is performed before any read back operation to examine which flash areas need to be read back from target. This improves performance of read back operations since it minimizes the amount of data to be transferred via JTAG and USB.

10.4.2.2 Logging

You may set some logging options to customize the log output of J-Flash SPI.

10.4.2.2.1 General log level

This specifies the log level of J-Flash SPI. Increasing log levels result in more information logged in the log window.

10.4.2.2.2 Enable J-Link logfile

If this option is checked, you can specify a file name for the J-Link logfile. The J-Link logfile differs from the log window output of J-Flash SPI. It does not log J-Flash SPI operations performed. Instead of that, it logs the J-Link ARM DLL API functions called from within J-Flash SPI.

10.5 Command Line Interface

This chapter describes the J-Flash SPI command line interface. The command line allows using J-Flash SPI in batch processing mode and other advanced uses.

10.5.1 Overview

In addition to its traditional Windows graphical user interface (GUI), J-Flash SPI supports a command line mode as well. This makes it possible to use J-Flash SPI for batch processing purposes. All important options accessible from the menus are available in command line mode as well. If you provide command line options, J-Flash SPI will still start its GUI, but processing will start immediately.

The screenshot below shows the command line help dialog, which is displayed if you start J-Flash SPI in a console window with <code>JFlashSPI.exe</code> -help or <code>JFlashSPI.exe</code> -?

.	/alid command line o openprj saveprjas saveprj	options: Opens an existing project Syntax: -openprj <filename> Saves current project in a different file Syntax: -saveprjas<filename> Saves current project</filename></filename>

		ОК

10.5.2 Command line options

This section lists and describes all available command line options. Some options accept additional parameters which are enclosed in angle brackets, e.g. <FILE-NAME>. If these parameters are optional they are enclosed in square brackets too, e.g. [<SADDR>]. Neither the angel nor the square brackets must be typed on the command line, they are used here only to denote (optional) parameters. Also, note that a parameter must follow immediately after the option,

e.g. JFlashSPI.exe -openprjC:\Projects\Default.jflash.

The command line options are evaluated in the order they are passed to J-Flash, so please ensure that a project and data file has already been opened when evaluating a command line option which requires this.

It is recommended to always use -open<FILENAME>[,<SADDR>] to make sure the right data file is opened.

All command line options return 0 if the processing was successful. A return value unequal 0 means that an error occured.

Option	Description
-?	Displays help dialog.
-auto	Erases, program and verify target.
-connect	Connects to target.
-delrange <saddr>,<eaddr></eaddr></saddr>	Deletes data in the given range.
-disconnect	Disconnects from target.
-eliminate	Eliminates blank areas in data file.
-erasechip	Erases the entire flash chip.
-erasesectors	Erases all sectors.
-exit	Exits application.
-help	Displays help dialog.
-merge <filename> -merge<filename>.bin,<addr></addr></filename></filename>	Merges a given file with the one currently opened. Note that when passing a .bin file via this com- mand, also the start-address where it shall be merged the file currently openend in J-Flash SPI must be given, too, since .bin files do not contain any address information.
-open <filename>[,<saddr>]</saddr></filename>	Open a data file. Please note that the <saddr> parameter applies only if the data file is a *.bin file.</saddr>
-openprj <filename></filename>	Open an existing project file. This will also automatically open the data file that has been recently used with this project.
-program	Program target.
-programverify	Program and verify target.
-readchip	Read entire flash chip.
-readrange <saddr>,<eaddr></eaddr></saddr>	Read specified range of target memory.
-save[<saddr>,<eaddr>]</eaddr></saddr>	Save the current data file. Please note that the parameters <saddr>,<eaddr> apply only if the data file is a *.bin file or *.c file.</eaddr></saddr>
-saveas <file- NAME>[,<saddr>,<eaddr>]</eaddr></saddr></file- 	Save the current data file into the specified file. Please note that the parameters <saddr>, <eaddr> apply only if the data file is a *.bin file or *.c file.</eaddr></saddr>
-saveprj	Save the current project.
-saveprjas <filename></filename>	Save the current project in the specified file.
-verify	Verify target memory.
-usb <sn></sn>	Overrides connection settings to USB.
<pre>-ip<xxx.xxx.xxx.xxx> -ip<hostname></hostname></xxx.xxx.xxx.xxx></pre>	Overrides connection settings to IP.

Table 10.10: J-Flash SPI command line options

10.5.3 Batch processing

J-Flash SPI can be used for batch processing purposes. All important options are available in command line mode as well. When providing command line options, the application does not wait for manual user input. All command line operations will be performed in exactly the order they are passed. So, for example issuing a program command before a project has been opened will cause the program command to fail.

The example batchfile below will cause J-Flash SPI to perform the following operations:

- 1. Open project C:\Projects\Default.jflash
- 2. Open bin file C:\Data\data.bin and set start address to 0x100000
- 3. Perform "Auto" operation in J-Flash (by default this performs erase, program, verify)
- 4. Close J-Flash SPI

The return value will be checked and in case of an error message will be displayed. Adapt the example according to the requirements of your project.

@ECHO OFF

```
ECHO Open a project and data file, start auto processing and exit
JFlashSPI.exe -openprjC:\Projects\Default.jflash -openC:\Data\data.bin,0x100000 -
auto -exit
IF ERRORLEVEL 1 goto ERROR
```

goto END

```
:ERROR
ECHO J-Flash SPI: Error!
pause
```

:END

Starting J-Flash minimized

Adapt this example call to start J-Flash SPI minimized:

```
start /min /wait "J-Flash" "JFlashSPI.exe" -openprjC:\Projects\Default.jflash
\
-openC:\Data\data.bin,0x100000 -auto -exit
```

Note that every call of <code>JFlashSPI.exe</code> has to be completed with the <code>-exit</code> option, otherwise the execution of the batch file stops and the following commands will not be processed.

10.5.4 Programming multiple targets in parallel

In order to program multiple targets in parallel using J-Flash SPI, the following is needed:

• Multiple J-Flash SPI projects, each configured to connect to a specific J-Link / Flasher (emulator to connect to is selected by serial number).

The easiest way is to setup the appropriate project once and then make multiple copies of this project. Now modify the Connection to J-Link setting in each project, in order to let J-Flash SPI connect to the different programmers as shown in the screenshot below:

Find below a small sample which shows how to program multiple targets in parallel:

Project settings	? 💌
General Interface Flash Productio	n)
i find	J-Flash SPI is a software for J-Link. This software is capable of programming SPI flash memories.
	Connection to J-Link C USB Device 0 C USB SN 123456789 Select C ICP/IP
	OK Cancel Apply

@ECHO OFF

ECHO Open first project which is configured to connect to the first J-Link. Open data file, start auto processing and exit open JFlashSPI.exe -openprjC:\Projects\Project01.jflash -openC:\Data\data.bin, 0x100000 -auto -exit IF ERRORLEVEL 1 goto ERROR

ECHO Open second project which is configured to connect to the second J-Link. Open data file, start auto processing and exit open JFlashSPI.exe -openprjC:\Projects\Project02.jflash -openC:\Data\data.bin, 0x100000 -auto -exit IF ERRORLEVEL 1 goto ERROR

ECHO Open third project which is configured to connect to the third J-Link. Open data file, start auto processing and exit open JFlashSPI.exe -openprjC:\Projects\Project03.jflash -openC:\Data\data.bin, 0x100000 -auto -exit IF ERRORLEVEL 1 goto ERROR

goto END

:ERROR ECHO J-Flash SPI: Error! pause

:END

Note that every call of JFlashSPI.exe has to completed with the -exit option, otherwise stops the execution of the batch file and the following commands will not be processed.

10.6 Create a new J-Flash SPI project

This chapter contains information about the required steps for the setup of a new J-Flash SPI project.

10.6.1 Creating a new J-Flash SPI project

Creating a new project for J-Flash is pretty simple. In the following, all necessary steps to create a project file are explained.

- 1. Select **File** -> **New Project** to create a new project with default settings.
- 2. Open the **Project Settings** context menu. Select **Options** -> **Project Settings** to open the **Project settings** dialog and select the type of connection to J-Link.

Project settings	? 💌
General Interface Flash Product	ion
r link	J-Flash SPI is a software for J-Link. This software is capable of programming SPI flash memories. Connection to J-Link © USB Device 0 USB SN 0 Select © ICP/IP
	OK Cancel Apply

3. Define the **SPI communication speed**. The default settings work without any problem for most targets, but to achieve the last quantum of performance, manual tuning may be necessary.

Project settings	? 🗙
General Interface Flash Production	
Interface speed	
OK Cancel	Apply

- 4. Open the **Flash** and either select **Automatically detect SPI flash** or manually enter the flash parameters.
- 5. Save the project (File -> Save Project) and test it.

10.6.2 Serial number programming

J-Flash SPI supports programming of serial numbers. In order to use the serial number programming feature, the J-Flash SPI project to be used as well as some files in the working folder (depending on the configuration) need to be configured first.

In general, J-Flash SPI supports two ways of programming a serial number into the target:

- 1. Programming continuous serial numbers. Serial number is 1-4 bytes in size. Start serial number, increment, serial number size and address have to be configured in the J-Flash SPI project production settings.
- 2. Programming custom serial numbers from a serial number list file. Start line of the serial number list file, line increment, serial number size and address is configured in J-Flash SPI production project settings. Serial number list file needs to be specified and created by user.

10.6.3 Send custom commands

J-Flash SPI supports sending custom sequences over SPI which may be different for different SPI flashes (e.g. program OTP, program security register, etc...). Due to the generic syntax, this feature can be used to implement any required command sequence. The sequence has to be specified in the J-Flash SPI project file (*.jflash) and therefore it can be included in automated production environments without any problems. The exit steps are executed right after programming the device using the "-auto" command.

Basically, the custom sequence is separated into different steps where each step contains the fields as in the table below. Some commands require to pass parameter to it. They are stored in Value0 and Value1 as described in the table below.

Step	Description	
<pre>ExitStepX_Action = "\$Action\$"</pre>	Any action as described in the table below.	
<pre>ExitStepX_Comment = "\$Comment\$"</pre>	User can specify any comment here. This field is optional and not taken into account.	
<pre>ExitStepX_Value0 = "\$Value0\$"</pre>	Value depends on the action. See table below.	
<pre>ExitStepX_Value1 = "\$Value1\$"</pre>	Value depends on the action. See table below.	

The number of exit steps needs to be specified right behind the ExitStep sequence with the line "NumExitSteps = <<u>NumExitSteps</u>>" (see example below).

Actions	Parameter	Description
Activate CS	none	Set CS signal low
Deactive CS	none	Set CS signal high
Write data	Value0=NumBytes Value1[x]=ByteStream max. NumBytes is 16	Send a number of bytes via the SPI inter- face to the SPI. Please note, that the num- ber of bytes has to be specified right behind Value1 in square brackets (e.g.: ExitStep4_Value1[3] = 0x44,0x00,0x10)
Delay	Value0=Delay in ms	Waits a given time

Below is a small example excerpt from a J-Flash project, which shows a example sequence to erase sector 0 of the SPI flash using the 0xD8 command. Further examples can be found in the installation directory of the J-Link software and documentation package.

```
[CPU]
  //
  // Set write enable
  //
  ExitStep0_Action = "Activate CS"
```

```
ExitStep0_Value0 = 0x0000000
ExitStep0_Value1 = 0x0000000
ExitStep1_Action = "Write data"
ExitStep1_Comment = "Set write enable"
ExitStep1_Value0 = 1
ExitStep1_Value1[1] = 0x06
ExitStep2_Action = "Deactivate CS"
ExitStep2_Comment = "Deactivate CS"
ExitStep2_Value0 = 0x0000000
ExitStep2_Value1 = 0x0000000
11
// Erase sector 0
11
ExitStep3_Action = "Activate CS"
ExitStep3_Comment = "Activate CS"
ExitStep3_Value0 = 0x0000000
ExitStep3_Value1 = 0x0000000
ExitStep4_Action = "Write data"
ExitStep4_Comment = "Set write enable"
ExitStep4_Value0 = 4
ExitStep4_Value1[4] = 0xD8, 0x00, 0x00, 0x00
ExitStep5_Action = "Deactivate CS"
ExitStep5_Comment = "Deactivate CS"
ExitStep5_Value0 = 0x0000000
ExitStep5_Value1 = 0x0000000
11
// Wait until sector has been erased
11
ExitStep6 Action = "Delay"
ExitStep6_Comment = "Wait until sector has been erased"
ExitStep6_Value0 = 0x0000080
ExitStep6_Value1 = 0x0000000
NumExitSteps = 7
```

10.7 Device specifics

This chapter gives some additional information about specific devices.

10.7.1 SPI flashes with multiple erase commands

Some SPI flashes support multiple erase commands that allow to erase different units on the flash. For example some flashes provide a sector erase (erase 4 KB units) and a block erase (erase 16 KB or 64 KB units) command. In general, it is up to the user which command to use, as the EraseSector command can be overridden by the user. When manually changing the SectorErase command in the **Options** -> **Project settings...** -> **Flash** tab, make sure that the SectorSize parameter matches the command being used.

10.8 Target systems

10.8.1 Which flash devices can be programmed?

In general, all kinds of SPI flash can be programmed. Since all flash parameters are configurable, also flashes with non-standard command sets can be programmed.

10.9 Performance

The following chapter lists programming performance for various SPI flash devices.

10.9.1 Performance values

In direct programming mode (J-Link directly connects to the pins of the SPI flash), the programming speed is mainly limited by the SPI communication speed, the USB speed of J-Link (if a Full-Speed or Hi-Speed based J-Link is used) and the maximum programming speed of the flash itself.

For most SPI flash devices, in direct programming mode speeds of >= 50 KB/s can be achieved.

10.10 Background information

This chapter provides some background information about specific parts of the J-Flash SPI software.

10.10.1 SPI interface connection

For direct SPI flash programming, J-Link needs to be wired to the SPI flash in a specific way. For more information about the pinout for the J-Link SPI target interface, please refer to *UM08001*, *J-Link J-Trace User Guide*. The minimum pins that need to be connected, are: VTref, GND, SPI-CLK, MOSI, MISO. If other components on the target hardware need to be kept in reset while programming the SPI flash (e.g. a CPU etc.), nRESET also needs to be connected.

10.11 Support

The following chapter provides advises on troubleshooting for possible typical problems and information about how to contact our support.

10.11.1 Troubleshooting

10.11.1.1Typical problems

Target system has no power

Meaning:

J-Link could not measure the target (flash) reference voltage on pin 1 of its connector.

Remedy:

The target interface of J-Link works with level shifters to be as flexible as possible. Therefore, the reference I/O voltage the flash is working with also needs to be connected to pin 1 of the J-Link connector.

Programming / Erasing failed

Meaning:

The SPI communication speed may be too high for the given signal quality.

Remedy:

Try again with a slower speed. If it still fails, check the quality of the SPI signals.

Failed to verify Flash ID

Meaning:

J-Link could not verify the ID of the connected flash.

Remedy:

Check the Flash ID entered in the flash parameters dialog, for correctness.

10.11.2 Contacting support

If you experience a J-Flash SPI related problem and advice given in the sections above does not help you to solve it, you may contact our support. In this case, please provide us with the following information:

- A detailed description of the problem.
- The relevant log file and project file. In order to generate an expressive log file, set the log level to "All messages" (see section *Global Settings* on page 296 for information about changing the log level in J-Flash SPI).
- The relevant data file as a .hex or .mot file (if possible).
- The processor and flash types used.

Once we received this information we will try our best to solve the problem for you. Our contact address is as follows:

SEGGER Microcontroller GmbH & Co. KG

In den Weiden 11 D-40721 Hilden

Germany

Tel.+49 2103-2878-0 Fax.+49 2103-2878-28 Email: support@segger.com Internet: http://www.segger.com

Chapter 11 RDI

RDI (Remote Debug Interface) is a standard defined by ARM, trying to standardize a debugger / debug probe interface. It is defined only for cores that have the same CPU register set as ARM7 CPUs. This chapter describes how to use the RDI DLL which comes with the J-Link software and documentation package. The J-Link RDI DLL allows the user to use J-Link with any RDI-compliant debugger and IDE.

11.1 Introduction

Remote Debug Interface (RDI) is an Application Programming Interface (API) that defines a standard set of data structures and functions that abstract hardware for debugging purposes. J-Link RDI mainly consists of a DLL designed for ARM cores to be used with any RDI compliant debugger. The J-Link DLL feature flash download and flash breakpoints can also be used with J-Link RDI.

11.1.1 Features

- Can be used with every RDI compliant debugger.
- Easy to use.
- Flash download feature of J-Link DLL can be used.
- Flash breakpoints feature of J-Link DLL can be used.
- Instruction set simulation (improves debugging performance).

11.2 Licensing

In order to use the J-Link RDI software a separate license is necessary for each J-Link. For some devices J-Link comes with a device-based license and some J-Link models also come with a full license for J-Link RDI. The normal J-Link however, comes without any licenses. For more information about licensing itself and which devices have a device-based license, please refer to *Licensing* on page 67.

11.3 Setup for various debuggers

The J-Link RDI software is an ARM Remote Debug Interface (RDI) for J-Link. It makes it possible to use J-Link with any RDI compliant debugger. Basically, J-Link RDI consists of a additional DLL (JLinkRDI.dll) which builds the interface between the RDI API and the normal J-Link DLL. The JLinkRDI.dll itself is part of the J-Link software and documentation package.

11.3.1 IAR Embedded Workbench IDE

J-Link RDI can be used with IAR Embedded Workbench for ARM.

11.3.1.1 Supported software versions

J-Link RDI has been tested with IAR Embedded Workbench IDE version 4.40. There should be no problems with other versions of IAR Embedded Workbench IDE. All screenshots are taken from IAR Embedded Workbench version 4.40.

Note: Since IAR EWARM V5.30 J-Link is fully and natively supported by EWARM, so RDI is no longer needed.

11.3.1.2 Configuring to use J-Link RDI

1. Start the IAR Embedded Workbench and open the tutor example project or the desired project. This tutor project has been preconfigured to use the simulator driver. In order to run the J-Link RDI, the driver needs to be changed.

2. Choose Project | Options and select the Debugger category. Change the

Category: General Options Factory Settings General Options C/C++ Compiler Assembler Download Extra Options Plugins Custom Build Driver Eun to Build Actions Linker Setup macros main Simulator Angel Lase macro file Juinker J-Link Use macro file Use macro file Use macro file Devige description file Diveride defauli StoOLKIT DIRS/CONFIG/Voot91sam7s64.ddf Image: Constant Constan	Driver	option to RDI.
	General Options C/C++ Compiler Assembler Custom Build Build Actions Linker Debugger Simulator Angel IAR ROM-monitor J-Link Macraigor RDI	Setup Download Extra Options Plugins Driver P Plugins Driver P Plugins Setup macros Use macro file Device description file

3. Go to the RDI page of the Debugger options, select the manufacturer driver (JLinkRDI.dll) and click **OK**.

	Factory Settings
RDI	
Manufacturer RDI driver C:\seggerWLinkRDI/ULinkRDI.dll	
C Allow hardware reset	Note Use the RDI menu to specify additional driver settings. (This menu is available after the RDI
ETM trace	driver has been located) Catch exceptions Beset Data EIQ
Log RDI <u>communication</u> \$TOOLKIT_DIR\$\cspycomm.log	Undef Erefetch
	Manufacturer RDI driver C:\segger\JLinkRDI\JLinkRDI.dll Allow hardware reset ETM trace Log RDI communication

 Now an extra menu, RDI, has been added to the menu bar. Choose RDI | Configure to configure the J-Link. For more information about the generic setup of J-Link RDI, please refer to *Configuration* on page 330.

X 1	AR En	nbedd	ed Workl	bench	IDE

	2	86	I 😂	<u>_</u> 0	onfigure			•

11.3.1.3 Debugging on Cortex-M3 devices

The RDI protocol has only been specified by ARM for ARM 7/9 cores. For Cortex-M there is no official extension of the RDI protocol regarding the register assignement, that has been approved by ARM. Since IAR EWARM version 5.11 it is possible to use J-Link RDI for Cortex-M devices because SEGGER and IAR have come to an agreement regarding the RDI register assignment for Cortex-M. The following table lists the register assignment for RDI and Cortex-M:

Register Index	Assigned register
0	RO
1	R1
2	R2
3	R3
4	R4
5	R5
6	R6
7	R7
8	R8
9	R9
10	R10
11	R11
12	R12
13	MSP / PSP (depending on mode)
14	R14 (LR)
16	R15 (PC)
17	XPSR
18	APSR
19	IPSR
20	EPSR
21	IAPSR
22	EAPSR
23	IEPSR
24	PRIMASK
25	FAULTMASK
26	BASEPRI
27	BASEPRI_MAX
28	CFBP (CONTROL/FAULT/BASEPRI/PRIMASK)

Table 11.1: Cortex-M register mapping for IAR + J-Link RDI

11.3.2 ARM AXD (ARM Developer Suite, ADS)

11.3.2.1 Software version

The JLinkRDI.dll has been tested with ARM's AXD version 1.2.0 and 1.2.1. There should be no problems with other versions of ARM's AXD. All screenshots are taken from ARM's AXD version 1.2.0.

11.3.2.2 Configuring to use J-Link RDI

1. Start the ARM debugger and select **Options** | **Configure Target...**. This opens the **Choose Target** dialog box:

Choose Target					? ×
- Target Environ	ments —				
Target	RDI	File		Version	Add
ARM TPA	1.5.1	C:\Tool\C\\RVT.DLL		1.0.0.19

11.3.3 ARM RVDS (RealView developer suite)

11.3.3.1 Software version

J-Link RDI has been tested with ARM RVDS version 2.1 and 3.0. There should be no problems with earlier versions of RVDS (up to version v3.0.1). All screenshots are taken from ARM's RVDS version 2.1.

Note: RVDS version 3.1 does not longer support RDI protocol to communicate with the debugger.

11.3.3.2 Configuring to use J-Link RDI

1. Start the Real View debugger:

RVDEBUG <start_str71x></start_str71x>				_ 🗆 ×

11.3.4 GHS MULTI

11.3.4.1 Software version

J-Link RDI has been tested with GHS MULTI version 4.07. There should be no problems with other versions of GHS MULTI. All screenshots are taken from GHS MULTI version 4.07.

11.3.4.2 Configuring to use J-Link RDI

1. Start Green Hills Software MULTI integrated development environment. Click **Connect** | **Connection Organizer** to open the **Connection Organizer**.

J-Link / J-Trace (UM08001)

2. Click **Method** | **New** in the **Connection Organizer** dialog.

3. The **Create a new Connection Method** will be opened. Enter a name for your configuration in the **Name** field and select **Custom** in the **Type** list. Confirm your choice with the **Create...** button.

Create N	Create New Connection Method				
Name:	J-Link				
Type:	Custom				
	Create Cancel				

4. The **Connection Editor** dialog will be opened. Enter **rdiserv** in the **Server** field and enter the following values in the **Arguments** field:

-config -dll <FullPathToJLinkDLLs>

Note that JLinkRDI.dll and JLinkARM.dll must be stored in the same directory. If the standard J-Link installation path or another path that includes spaces has been used, enclose the path in quotation marks.

Example:

-config -dll "C:\Program Files\SEGGER\JLinkARM_V350g\JLinkRDI.dll" Refer to GHS manual "MULTI: Configuring Connections for ARM Targets", chapter "ARM Remote Debug Interface (rdiserv) Connections" for a complete list of possible arguments.

11.4 Configuration

This section describes the generic setup of J-Link RDI (same for all debuggers) using the J-Link RDI configuration dialog.

11.4.1 Configuration file JLinkRDI.ini

All settings are stored in the file <code>JLinkRDI.ini</code>. This file is located in the same directory as <code>JLinkRDI.dll</code>.

11.4.2 Using different configurations

It can be desirable to use different configurations for different targets. If this is the case, a new folder needs to be created and the <code>JLinkARM.dll</code> as well as the <code>JLinkRDI.dll</code> needs to be copied into it.

Project A needs to be configured to use JLinkRDI.dll A in the first folder, project B needs to be configured to use the DLL in the second folder. Both projects will use separate configuration files, stored in the same directory as the DLLs they are using.

If the debugger allows using a project-relative path (such as IAR EWARM: Use for example $proj_DIR$, rdl\), it can make sense to create the directory for the DLLs and configuration file in a subdirectory of the project.

11.4.3 Using mutliple J-Links simulatenously

Same procedure as using different configurations. Each debugger session will use their own instance of the $\tt JLinkRDI.dll$.

11.4.4 Configuration dialog

The configuration dialog consists of several tabs making the configuration of J-Link RDI very easy.

11.4.4.1 General tab

J-Link RDI Configuration	? ×
General Init JTAG Flash Bre Image: State of the state o	eakpoints CPU Log J-Link-RDI is an RDI compliant software for J-Link ARM. It requires a license (RDI), which can be obtained from SEGGER (www.segger.com). This software is also capable of programming the flash memory of several ARM micros, which can be used to download your program to flash (Requires the add. license "FlashDL") and to set an unlimited number of software breakpoints in flash (Requires the add. license "FlashBP"). Connection to J-Link USB Device 0 ICP/IP About License Reset Config
	OK Cancel Apply

Connection to J-Link

This setting allows the user to configure how the DLL should connect to the J-Link. Some J-Link models also come with an Ethernet interface which allows to use an emulator remotely via TCP/IP connection.

License (J-Link RDI License managment)

1. The **License** button opens the **J-Link RDI License management** dialog. J-Link RDI requires a valid license.

J-	Link RDI License management		×
	Feature	Serial number	Expiration
	<u>Add license</u> <u>D</u> elete lice	nse Display <u>s</u> erial nu	mber OK

2. Click the Add license button and enter your license. Confirm your input by click-

ing the **OK** button.

Add licens	e			×
Please ent	er your license(s)!			
<u>L</u> icense				
			OK	Cancel

3. The J-Link RDI license is now added.

J-	Link RDI License management		×
	Feature	Serial number	Expiration
	RDI	1	never expires
	Add license Delete lice	ense Display <u>s</u> erial nur	mber OK

11.4.4.2 Init tab

J-Link RDI Configuration
General Init JTAG Flash Breakpoints CPU Log
Use macro file
OK Cancel Apply

Macro file

A macro file can be specified to load custom settings to configure J-Link RDI with advanced commands for special chips or operations. For example, a macro file can be used to initialize a target to use the PLL before the target application is downloaded, in order to speed up the download.

Comands in the macro file

Command	Description
SetJTAGSpeed(x);	Sets the JTAG speed, $x =$ speed in kHz (0=Auto)
Delay(x);	Waits a given time, x = delay in milliseconds
Reset(x);	Resets the target, x = delay in milliseconds
Go();	Starts the ARM core
Halt();	Halts the ARM core
Read8(Addr);	Deade a $9/16/22$ bit value
Read16(Addr);	Reads a 8/16/32 bit value, Addr = address to read (as hex value)
Read32(Addr);	Addr – address to read (as nex value)
<pre>Verify8(Addr, Data);</pre>	Verifies a 8/16/32 bit value,
<pre>Verify16(Addr, Data);</pre>	Addr = address to verify (as hex value)
<pre>Verify32(Addr, Data);</pre>	Data = data to verify (as hex value)
<pre>Write8(Addr, Data);</pre>	Writes a 8/16/32 bit value,
<pre>Write16(Addr, Data);</pre>	Addr = address to write (as hex value)
<pre>Write32(Addr, Data);</pre>	Data = data to write (as hex value)
<pre>WriteVerify8(Addr, Data);</pre>	Writes and verifies a 8/16/32 bit value,
<pre>WriteVerify16(Addr, Data);</pre>	Addr = address to write (as hex value)
<pre>WriteVerify32(Addr, Data);</pre>	Data = data to write (as hex value)
<pre>WriteRegister(Reg, Data);</pre>	Writes a register
<pre>WriteJTAG_IR(Cmd);</pre>	Writes the JTAG instruction register
<pre>WriteJTAG_DR(nBits, Data);</pre>	Writes the JTAG data register
Table 11.2: Macro file commands	

Example of macro file

11.4.4.3 JTAG tab

J-Link RDI Configuration	? ×
General Init JTAG	Flash Breakpoints CPU Log
JTAG speed	
C Auto selection	
C Adaptive <u>c</u> locking	
⊙ 30 <u>▼</u> <u>k</u> Hz	
JTAG scan chain with	a multiple devices
	·
Position 0	JR len 0
0 is closest to TDI.	Sum of IRLens of devices closer to TD1. IRLen of ARM chips is 4.
	VerifyJTAG config
	OK Cancel <u>Apply</u>

JTAG speed

This allows the selection of the JTAG speed. There are basically three types of speed settings (which are explained below):

- Fixed JTAG speed
- Automatic JTAG speed
- Adaptive clocking

For more information about the different speed settings supported by J-Link, please refer to *JTAG Speed* on page 184.

JTAG scan chain with multiple devices

The JTAG scan chain allows to specify the instruction register organization of the target system. This may be needed if there are more devices located on the target system than the ARM chip you want to access or if more than one target system is connected to one J-Link at once.

11.4.4.4 Flash tab

J-Link RDI Configuration 🔹 🔋 🗙					
General Init JTAG Flash Breakpoints CPU Log					
Enable flash programming					
Allows programming the flash. This is required to download a program into flash memory or to set software breakpoints in flash (flash breakpoints).					
Device Atmel AT 91 SAM 7S64 Clock speed 48000000 Hz RAM 16 KB @ address 0x200000 Flash 64 KB @ address 0x100000 Flash Fla					
Flash is mirrored @ address 0x0					
Cache flash contents Allows caching of flash contents. This avoids reading data twice and speeds up the transfer between debugger and target.					
Allow flash download Allows program download to flash. Your debugger does not need to have a flash loader. This feature requires an additional license (FlashDL).					
Show info window during download					
OK Cancel Apply					

Enable flash programming

This checkbox enables flash programming. Flash programming is needed to use either flash download or flash breakpoints.

If flash programming is enabled you must select the correct flash memory and flash base address. Furthermore it is necessary for some chips to enter the correct CPU clock frequence.

Cache flash contents

If enabled, the flash content is cached by the J-Link RDI software to avoid reading data twice and to speed up the transfer between debugger and target.

Allow flash download

This allows the J-Link RDI software to download program into flash. A small piece of code will be downloaded and executed in the target RAM which then programs the flash memory. This provides flash loading abilities even for debuggers without a build-in flash loader.

An info window can be shown during download displaying the current operation. Depending on your JTAG speed you may see the info window only very short.

J-Link flash programming
Finished flash programming.

11.4.4.5 Breakpoints tab

J-Link RDI Configuration	? ×					
General Init JTAG Flash Breakpoints CPU Log						
Use software breakpoints						
Software breakpoints (as opposed to hardware breakpoints) are breakpoints which modify program memory. This allows setting an unlimited number of breakpoints if the program is located in RAM.						
Use flash breakpoints						
Allows setting an unlimited number of breakpoints if the program is located in RAM or flash, which is extremely valuable when debugging a program located in flash.						
This feature is available only if flash programming is enabled!						
Show info window during program						
OK Cancel Appl	y					

Use software breakpoints

This allows to set an unlimited number of breakpoints if the program is located in RAM by setting and resetting breakpoints according to program code.

Use flash breakpoints

This allows to set an unlimited number of breakpoints if the program is located either in RAM or in flash by setting and resetting breakpoints according to program code.

An info window can be displayed while flash breakpoints are used showing the current operation. Depending on your JTAG speed the info window may hardly to be seen.

11.4.4.6 CPU tab

J-Link RDI Configuration
General Init JTAG Flash Breakpoints CPU Log Image: Allow instruction set simulation Allows instruction set simulation Allows the emulator to simulate individual instructions when single stepping instructions. This does not normally have any disadvantages and makes debugging much faster, especially when using flash breakpoints.
Reset strategy J-Link supports different reset strategies. This is necessary because there is no single way of resetting and halting an ARM core before it starts to execute instructions. Hardware, halt after reset (normal) The start of
The hardware RESET pin is used to reset the CPU. After reset release, J-Link continuously tries to halt the CPU. This typically halts the CPU shortly after reset release; the CPU can in most systems execute some instructions before it is halted. The number of instructions executed depends primarily on the JTAG speed: the higher the JTAG speed, the faster the CPU can be halted. Some CPUs can actually be halted before executing any instruction, because the start of the CPU is delayed after reset release. If a pause has been specified, J-Link waits for the specified time before trying to halt the CPU. This can be useful if a bootloader which resides in flash or ROM needs to be started after reset.
OK Cancel Apply

Instruction set simulation

This enables instruction set simulation which speeds up single stepping instructions especially when using flash breakpoints.

Reset strategy

This defines the way J-Link RDI should handle resets called by software.

J-Link supports different reset strategies. This is necessary because there is no single way of resetting and halting an ARM core before it starts to execute instructions.

For more information about the different reset strategies which are supported by J-Link and why different reset strategies are necessary, please refer to *Reset strategies* on page 199.

11.4.4.7 Log tab

A log file can be generated for the J-Link DLL and for the J-Link RDI DLL. This log files may be useful for debugging and evaluating. They may help you to solve a problem yourself, but is also needed by customer support help you.

Default path of the J-Link log file: c:\JLinkARM.log Default path of the J-Link RDI log file: c:\JLinkRDI.log

Example of logfile content:

060:028 (0000) Logging started @ 2005-10-28 07:36 speed: 4000 kHz 060:059 (0000) ARM_SetEndian(ARM_ENDIAN_LITTLE) 060:060 (0000) ARM_SetEndian(ARM_ENDIAN_LITTLE) 060:060 (0000) ARM_ResetPullsRESET(ON) 060:060 (0116) ARM_Reset(): SpeedIsFixed == 0 -> JTAGSpeed = 30kHz >48> >2EF> 060:176 (0000) ARM_WriteIceReg(0x02,0000000) 060:177 (0016) ARM_WriteMem(FFFFFC20,0004) -- Data: 01 06 00 00 - Writing 0x4 bytes @ 0xFFFFFC20 >1D7> 060:194 (0014) ARM_WriteMem(FFFFFC2C,0004) -- Data: 05 1C 19 00 - Writing 0x4 bytes @ 0xFFFFFC2C >195> 060:208 (0015) ARM_WriteMem(FFFFFC30,0004) -- Data: 07 00 00 00 - Writing 0x4 bytes @ 0xFFFFFC30 >195> 060:223 (0002) ARM_ReadMem (00000000,0004)JTAG speed: 4000 kHz -- Data: 0C 00 00 EA 060:225 (0001) ARM_WriteMem(0000000,0004) -- Data: 0D 00 00 EA - Writing 0x4 bytes @ 0x0000000 >195> 060:226 (0001) ARM_ReadMem (00000000,0004) -- Data: 0C 00 00 EA 060:227 (0001) ARM WriteMem(FFFFF00,0004) -- Data: 01 00 00 00 - Writing 0x4 bytes @ 0xFFFFFF00 >195> 060:228 (0001) ARM_ReadMem (FFFFF240,0004) -- Data: 40 05 09 27 060:229 (0001) ARM_ReadMem (FFFFF244,0004) -- Data: 00 00 00 00 060:230 (0001) ARM_ReadMem (FFFFF6C,0004) -- Data: 10 01 00 00 060:232 (0000) ARM WriteMem(FFFFF124,0004) -- Data: FF FF FF FF - Writing 0x4 bytes @ 0xFFFFF124 >195> 060:232 (0001) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:233 (0001) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:234 (0001) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:236 (0000) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:237 (0000) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:238 (0001) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:239 (0001) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:240 (0001) ARM_ReadMem (FFFFF130,0004) -- Data: 00 00 00 00 060:241 (0001) ARM_WriteMem(FFFFFD44,0004) -- Data: 00 80 00 00 - Writing 0x4 bytes @ 0xFFFFFD44 >195> 060:277 (0000) ARM_WriteMem(0000000,0178) -- Data: 0F 00 00 EA FE FF FF EA 060:277 (0000) ARM_WriteMem(000003C4,0020) -- Data: 01 00 00 02 00 00 00 ... . . .

11.5 Semihosting

Semihosting can be used with J-Link RDI. For more information how to enable semihosting in J-Link RDI, please refer to *Enabling Semihosting in J-Link RDI* + *AXD* on page 444.

11.5.1 Unexpected / unhandled SWIs

When an unhandled SWI is detected by J-Link RDI, the message box below is shown.

J-Link RD	l Warning 🛛 🗙
	Software interrupt (SWI) 0x0 occured in ARM mode @ address 0x002002C4.
-	This SWI is not used for semihosting, but causes the CPU core to be halted. Do you want the core to be automatically restarted when this happens ?
	NOTE: Clicking on 'yes' will prevent this message from popping up, but the core will still be halted every time. If your application requires semihosting as well as having its own SWI handler, you should set the semihosting vector to an address in your SWI handler. This address must point to an instruction that is only executed if your SWI handler has identified a call to a semihosting SWI. All registers must already have been restored to whatever values they had on entry to your SWI handler.
	For more information on semihosting and SWIs, please refer to the ARM ADS debug target guide.

CHAPTER

Chapter 12 RTT

SEGGER's Real Time Terminal (RTT) is a technology for interactive user I/O in embedded applications. It combines the advantages of SWO and semihosting at very high performance.

12.1 Introduction

With RTT it is possible to output information from the target microcontroller as well as sending input to the application at a very high speed without affecting the target's real time behavior.

SEGGER RTT can be used with any J-Link model and any supported target processor which allows background memory access, which are Cortex-M and RX targets.

RTT supports multiple channels in both directions, up to the host and down to the target, which can be used for different purposes and provide the most possible freedom to the user.

The default implementation uses one channel per direction, which are meant for printable terminal input and output. With the J-Link RTT Viewer this channel can be used for multiple "virtual" terminals, allowing to print to multiple windows (e.g. one for standard output, one for error output, one for debugging output) with just one target buffer. An additional up (to host) channel can for example be used to send profiling or event tracing data.

12.2 How RTT works

12.2.1 Target implementation

Real Time Terminal uses a SEGGER RTT Control Block structure in the target's memory to manage data reads and writes.

The control block contains an ID to make it findable in memory by a connected J-Link and a ring buffer structure for each available channel, describing the channel buffer and its state.

The maximum number of available channels can be configured at compile time and each buffer can be configured and added by the application at run time. Up and down buffers can be handled separately.

Each channel can be configured to be blocking or non-blocking. In blocking mode the application will wait when the buffer is full, until all memory could be written, resulting in a blocked application state but preventing data from getting lost. In non-blocking mode only data which fits into the buffer, or none at all, will be written and the rest will be discarded. This allows running in real-time, even when no debugger is connected. The developer does not have to create a special debug version and the code can stay in place in a release application.

12.2.2 Locating the Control Block

When RTT is active on the host computer, either by using RTT directly via an application like RTT Viewer or by connecting via Telnet to an application which is using J-Link, like a debugger, J-Link automatically searches for the SEGGER RTT Control Block in the target's known RAM regions. The RAM regions or the specific address of the Control Block can also be set via the host applications to speed up detection or if the block cannot be found automatically.

12.2.2.1 Manual specification of the Control Block location

While auto-detection of the RTT control block location works fine for most targets, it is always possible to manually specify either the exact location of the control block or to specify a certain address range J-Link shall search for a control block for in. This is done via the following command strings:

- SetRTTAddr on page 237
- SetRTTSearchRanges on page 237

For more information about how to use J-Link command strings in various environments, please refer to *Using command strings* on page 241

12.2.3 Internal structures

There may be any number of "Up Buffer Descriptors" (Target -> Host), as well as any number of "Down Buffer Descriptors" (Host -> Target). Each buffer size can be configured individually.

The gray areas in the buffers are the areas that contain valid data.

For Up buffers, the Write Pointer is written by the target, the Read Pointer is written by the debug probe (J-Link, Host).

When Read and Write Pointers point to the same element, the buffer is empty. This assures there is never a race condition. The image shows the simplified structure in the target.

12.2.4 Requirements

SEGGER RTT does not need any additional pin or hardware, despite a J-Link connected via the standard debug port to the target. It does not require any configuration of the target or in the debugging environment and can even be used with varying target speeds.

RTT can be used in parallel to a running debug session, without intrusion, as well as without any IDE or debugger at all.

12.2.5 Performance

The performance of SEGGER RTT is significantly higher than any other technology used to output data to a host PC. An average line of text can be output in one microsecond or less. Basically only the time to do a single memcopy().

12.2.6 Memory footprint

The RTT implementation code uses ~500 Bytes of ROM and 24 Bytes ID + 24 Bytes per channel for the control block in RAM. Each channel requires some memory for the buffer. The recommended sizes are 1 kByte for up channels and 16 to 32 Bytes for down channels depending on the load of in- / output.

12.3 RTT Communication

Communication with the RTT implementation on the target can be done with different applications. The functionality can even be integrated into custom applications using the J-Link SDK.

Using RTT in the target application is made easy. The implementation code is freely available for download and can be integrated into any existing application. To communicate via RTT any J-Link can be used.

The simple way to communicate via the Terminal (Channel 0) is to create a connection to localhost:19021 with a Telnet client or similar, when a connection to J-Link (e.g. via a debug session) is active.

The J-Link Software Package comes with some more advanced applications, which demonstrates RTT functionality for different purposes.

J-Link RTT Viewer is a Windows GUI application to use all features of RTT in one application. It supports:

- Displaying terminal output of Channel 0.
- Up to 16 virtual Terminals on Channel 0.
- Sending text input to Channel 0.
- Interpreting text control codes for colored text and controling the Terminal.
- Logging data on Channel 1.

12.3.1.1 RTT Viewer Startup

Make sure J-Link and target device are connected and powered up.

Start RTT Viewer by opening the executable (JLinkRTTViewer.exe) from the installation folder of the J-Link Software or the start menu.

The Configuration Dialog will pop up.

Configure the Connection Settings as described below and click OK. The connection settings and all in app configuration will be saved for the next start of RTT Viewer.

12.3.1.2 Connection Settings

RTT Viewer can be used in two modes:

• Stand-alone, opening an own connection to J-Link and target.

• In attach mode, connecting to an existing J-Link connection of a debugger.

J-Link RTT Viewer V4.96 Configuration 🛛 🔀					
Connection to J-Link					
<u>U</u> SB					
○ <u>T</u> CP/IP					
C Existing Session					
Target Device					
STM32F407IE					
Target Interface & Speed					
SWD • 12000 • kHz					
RTT Control Block					
Address (0: Auto) 0					
OK Cancel					

Stand-alone connection settings

In stand-alone mode RTT Viewer needs to know some settings of J-Link and target device.

Select USB or TCP/IP as the connection to J-Link. For USB a specific J-Link serial number can optionally be entered, for TCP/IP the IP or hostname of the J-Link has to be entered.

Select the target device to connect to. This allows J-Link to search in the known RAM of the target.

Select the target interface and its speed.

If known, enter the address of the RTT Control Block in the target application. Otherwise leave as 0 for auto detection.

Attaching to a connection

In attach mode RTT Viewer does not need any settings. Select Existing Session.

For attach mode a connection to J-Link has to be opened and configured by another application like a debugger or simply J-Link Commander. If the RTT Control Block cannot be found automatically, configuration of its location has to be done by the debugger / application.

12.3.1.3 The Terminal Tabs

RTT Viewer allows displaying the output of Channel 0 in different "virtual" Terminals.

The target application can switch between terminals with SEGGER_RTT_SetTerminal() and SEGGER_RTT_TerminalOut().

RTT Viewer displays the Terminals in different tabs.

All Te	minais
0>	SEGGER Real-Time-Terminal Sample
1>	Using Terminal 1 for error output.
2>	Terminal 2 sends additional debug information.
0>	
<	Sending some input.
0>	Sending some input.

All Terminals

All Terminals

The All Terminals tab displays the complete output of RTT Channel 0 and can display the user input (Check Input -> Echo input... -> Echo to "All Terminals").

Each output line is prefixed by the Terminal it has been sent to. Additionally, output on Terminal 1 is shown in red, output on Terminals 2 - 15 in grey.

Terminal 0 - 15

Each tab Terminal 0 - Terminal 15 displays the output which has been sent to this Terminal. The Terminal tabs interpret and display Text Control Codes as sent by the application to show colored text or erase the screen.

By default, if the RTT application does not set a Terminal Id, the output is displayed in Terminal 0.

The Teminal 0 tab can additionally display the user input. (Check Input -> Echo input... -> Echo to "Terminal 0")

Each Terminal tab can be shown or hidden via the menu Terminals -> Terminals... or their respective shortcuts as described below.

12.3.1.4 Sending Input

RTT Viewer supports sending user input to RTT Down Channel 0 which can be read by the target application with SEGGER_RTT_GetKey() and SEGGER_RTT_Read().

Input can be entered in the text box below the Teminal Tabs.

RTT Viewer can be configured to directly send each character while typing or buffer it until Enter is pressed (Menu Input -> Sending...).

In stand-alone mode RTT Viewer can retry to send input, in case the target input buffer is full, until all data could be sent to the target via Input -> Sending... -> Block if FIFO full.

Sending input	×
Please Wait 43 of 69 Bytes sent to target.	
	Cancel

12.3.1.5 Logging Data

Additionally to displaying output of Channel 0, RTT Viewer can log data which is sent on RTT Channel 1 into a file. This can for example be used to sent instrumentalized event tracing data. The data log file contains header and footer and the binary data as received from the application.

Logging can be started via Data -> Start Logging....

Note: Logging is only available in stand-alone mode.

Menu entry	Contents	Shortcut	
File	1		
-> Exit	Closes connection and exit RTT Viewer.	Alt-Q	
Terminals			
-> Add next terminal	Opens the next available Terminal Tab.	Alt-A	
-> Close active terminal	Closes the active Terminal Tab.	Alt-C	
-> Show Log	Opens or closes the Log Tab.	Alt-L	
Terminals -> Terminals			
> Terminal 0 - 9	Opens or closes the Terminal Tab.	Alt-0 - Alt-9	
> Terminal 10 - 15	Opens or closes the Terminal Tab.		
Input			
-> Clear input field	Clears the input field without sending entered data.	Button 'Clear'	
Input -> Sending			
> Send on Input	If selected, entered input will be sent directly to the target while typing.		
> Send on Enter	If selected, entered input will be sent when pressing Enter.		
> Block if FIFO full	If checked, RTT Viewer will retry to send all input to the target when the target buffer is full.		
Input -> End of line			
> Windows format (CR+LF) > Unix format (LF) > Mac format (CR) > None	Selects the end of line character to be sent on Enter.		
Input -> Echo input	1		
> Echo to "All Terminals"	If checked, sent input will be displayed in the All Terminals Tab.		
> Echo to "Terminal 0"	If checked, sent input will be dis- played in the Terminal Tab 0.		
Data			
-> Start logging	Starts logging data of Channel 1 to a file.	F5	
-> Stop logging	Stops loggind data and close the file.	Shift-F5	
Help			
-> About	Shows version info of RTT Viewer.	F12

Table 12.1: RTT Viewer Menus and Shortcuts

12.3.1.7 Using "virtual" Terminals in RTT

For virtual Terminals the target application needs only Up Channel 0. This is especially important on targets with low RAM.

If nothing is configured, all data is sent to Terminal 0.

The Teminal to output all following via Write, WriteString or printf can be set with SEGGER_RTT_SetTerminal() .

Output of only one string via a specific Terminal can be done with SEGGER_RTT_TerminalOut().

The sequences sent to change the Terminal are interpreted by RTT Viewer. Other applications like a Telnet Client will ignore them.

12.3.1.8 Using Text Control Codes

RTT allows using Text Control Codes (ANSI escape codes) to configure the display of text.

RTT Viewer supports changing the text color and background color and can erase the Terminal.

These Control Codes are pre-defined in the RTT application and can easily be used in the application.

Example 1:

Example 2:

12.3.2 RTT Client

J-Link RTT Client acts as a Telnet client, but automatically tries to reconnect to a J-Link connection when a debug session is closed.

The J-Link RTT Client is part of the J-Link Software and Documentation Pack for Windows, Linux and OS X and can be used for simple RTT use cases.

12.3.3 RTT Logger

With J-Link RTT Logger, data from Up-Channel 1 can be read and logged to a file. This channel can for example be used to send performance analysis data to the host.

J-Link RTT Logger opens a dedicated connection to J-Link and can be used standalone, without running a debugger.

The application is part of the J-Link Software and Documentation Pack for Windows, Linux and OS X.

The source of J-Link RTT Logger can be used as a starting point to integrate RTT in other PC applications, like debuggers, and is part of the J-Link SDK.

12.3.4 RTT in other host applications

RTT can also be integrated in any other PC application like a debugger or a data visualizer in either of two ways.

- 1. The application can establish a socket connection to the RTT Telnet Server which is opened on localhost:19021 when a J-Link connection is active.
- 2. The application creates its own connection to J-Link and uses the J-Link RTT API which is part of the J-Link SDK to directly configure and use RTT.

12.4 Implementation

The SEGGER RTT implementation code is written in ANSI C and can be integrated into any embedded application by simply adding the available sources.

RTT can be used via a simple and easy to use API. It is even possible to override the standard printf() functions to be used with RTT. Using RTT reduces the time taken for output to a minimum and allows printing debug information to the host computer while the application is performing time critical real time tasks.

The implementation code also includes a simple version of printf() which can be used to write formatted strings via RTT. It is smaller than most standard library printf() implementations and does not require heap and only a configureable ammount of stack.

The SEGGER RTT implementation is fully configureable at compile time with pre-processor defines. The number of channels, the size of the default channels can be set. Reading and writing can be made task-safe with definable Lock() and Unlock() routines.

12.4.1 API functions

The following API functions are available in the RTT Implementation. To use them SEGGER_RTT.h has to be included in the calling sources.

12.4.1.1 SEGGER_RTT_ConfigDownBuffer()

Description

Configure or add a down buffer by specifying its name, size and flags.

Prototype

```
int SEGGER_RTT_ConfigDownBuffer (unsigned BufferIndex, const char* sName,
char* pBuffer, int BufferSize, int Flags);
```

Parameters

Parameter	Meaning
BufferIndex	Index of the buffer to configure. Must be lower than SEGGER_RTT_MAX_NUM_DOWN_CHANNELS.
sName	Pointer to a 0-terminated string to be displayed as the name of the channel.
pBuffer	Pointer to a buffer used by the channel.
BufferSize	Size of the buffer in Bytes.
Flags	Flags of the channel (blocking or non-blocking).
Table 12 2: SECCE	R RTT ConfigDownBuffer() parameter list

Table 12.2: SEGGER_RTT_ConfigDownBuffer() parameter list

Return value

```
>= 0 0.K.
< 0 Error.
```

Example

```
// Configure down channel 1
//
SEGGER_RTT_ConfigDownChannel(1, "DataIn", &abDataIn[0], sizeof(abDataIn),
SEGGER_RTT_MODE_NO_BLOCK_SKIP);
```

Additional information

Once a channel is configured only the flags of the channel should be changed.

12.4.1.2 SEGGER_RTT_ConfigUpBuffer()

Description

Configure or add an up buffer by specifying its name, size and flags.

Prototype

```
int SEGGER_RTT_ConfigUpBuffer (unsigned BufferIndex, const char* sName,
char* pBuffer, int BufferSize, int Flags);
```

Parameters

Parameter	Meaning
BufferIndex	Index of the buffer to configure. Must be lower than SEGGER_RTT_MAX_NUM_UP_CHANNELS.
sName	Pointer to a 0-terminated string to be displayed as the name of the channel.
pBuffer	Pointer to a buffer used by the channel.
BufferSize	Size of the buffer in Bytes.
Flags	Flags of the channel (blocking or non-blocking).

Table 12.3: SEGGER_RTT_ConfigUpBuffer() parameter list

Return value

< 0 Error.

Example

Additional information

Once a channel is configured only the flags of the channel should be changed.

12.4.1.3 SEGGER_RTT_GetKey()

Description

Reads one character from SEGGER RTT buffer 0. Host has previously stored data there.

Prototype

int SEGGER_RTT_GetKey (void);

Return value

- < 0 No character available (empty buffer).
- >= 0 Character which has been read (0 255).

Example

```
int c;
c = SEGGER_RTT_GetKey();
if (c == 'q') {
    exit();
}
```

12.4.1.4 SEGGER_RTT_HasKey()

Description

Checks if at least one character for reading is available in SEGGER RTT buffer. 0

Prototype

int SEGGER_RTT_HasKey (void);

Return value

- 0 No characters are available to be read.
- 1 At least one character is available in the buffer.

Example

```
if (SEGGER_RTT_HasKey()) {
    int c = SEGGER_RTT_GetKey();
}
```

12.4.1.5 SEGGER_RTT_Init()

Description

Initializes the RTT Control Block.

Prototype

void SEGGER_RTT_Init (void);

Additional information

Should be used in RAM targets, at start of the application.

12.4.1.6 SEGGER_RTT_printf()

Description

Send a formatted string to the host.

Prototype

int SEGGER_RTT_printf (unsigned BufferIndex, const char * sFormat, ...)

Parameters

Parameter	Meaning
BufferIndex	Index of the up channel to sent the string to.
sFormat	Pointer to format string, followed by arguments for conversion.
Table 12 4: SECCED DTT printf() parameter list	

Table 12.4: SEGGER_RTT_printf() parameter list

Return value

>= 0 Number of bytes which have been sent.

< 0 Error.

Example

SEGGER_RTT_printf(0, "SEGGER RTT Sample. Uptime: %.10dms.", /*OS_Time*/ 890912); // Formatted output on channel 0: SEGGER RTT Sample. Uptime: 890912ms.

Additional information

(1) Conversion specifications have following syntax:

%[flags][FieldWidth][.Precision]ConversionSpecifier

(2) Supported flags:

- -: Left justify within the field width
- +: Always print sign extension for signed conversions
- 0: Pad with 0 instead of spaces. Ignored when using '-'-flag or precision

(3) Supported conversion specifiers:

- c: Print the argument as one char
- d: Print the argument as a signed integer
- u: Print the argument as an unsigned integer
- x: Print the argument as an hexadecimal integer
- s: Print the string pointed to by the argument
- p: Print the argument as an 8-digit hexadecimal integer. (Argument shall be a pointer to void.)

12.4.1.7 SEGGER_RTT_Read()

Description

Read characters from any RTT down channel which have been previously stored by the host.

Prototype

int SEGGER_RTT_Read (unsigned BufferIndex, char* pBuffer, unsigned BufferSize);

Parameters

Parameter	Meaning
BufferIndex	Index of the down channel to read from.
pBuffer	Pointer to a character buffer to store the read characters.
BufferSize	Number of bytes available in the buffer.
Table 12.5: SEGGER_RTT_Read() parameter list	

Return value

>= 0 Number of bytes that have been read.

Example

```
char acIn[4];
int NumBytes = sizeof(acIn);
NumBytes = SEGGER_RTT_Read(0, &acIn[0], NumBytes);
if (NumBytes) {
    AnalyzeInput(acIn);
}
```

12.4.1.8 SEGGER_RTT_SetTerminal()

Description

Set the "virtual" terminal to send following data on channel 0.

Prototype

```
void SEGGER_RTT_SetTerminal(char TerminalId);
```

Parameters

Parameter	Meaning
TerminalId	Id of the virtual terminal (0-9).
Table 12 6, SECCED BTT SetTerminal() parameter list	

Table 12.6: SEGGER_RTT_SetTerminal() parameter list

Example

```
// Send a string to terminal 1 which is used as error out.
//
SEGGER_RTT_SetTerminal(1); // Select terminal 1
SEGGER_RTT_WriteString(0, "ERROR: Buffer overflow");
SEGGER_RTT_SetTerminal(0); // Reset to standard terminal
```

Additional information

All following data which is sent via channel 0 will be printed on the set terminal until the next change.

12.4.1.9 SEGGER_RTT_TerminalOut()

Description

Send one string to a specific "virtual" terminal.

Prototype

int SEGGER_RTT_TerminalOut (char TerminalID, const char* s);

Parameters

Parameter	Meaning
TerminalId	Id of the virtual terminal (0-9).
S	Pointer to 0-terminated string to be sent.

Table 12.7: SEGGER_RTT_TerminalOut() parameter list

Return value

>= 0 Number of bytes sent to the terminal.

Example

```
//
// Sent a string to terminal 1 without changing the standard terminal.
//
SEGGER_RTT_TerminalOut(1, "ERROR: Buffer overflow.");
```

Additional information

SEGGER_RTT_TerminalOut does not affect following data which is sent via channel 0.

12.4.1.10SEGGER_RTT_Write()

Description

Send data to the host on an RTT channel.

Prototype

```
int SEGGER_RTT_Write (unsigned BufferIndex, const char* pBuffer, unsigned
NumBytes);
```

Parameters

Parameter	Meaning
BufferIndex	Index of the up channel to send data to.
pBuffer	Pointer to data to be sent.
NumBytes	Number of bytes to send.
Table 12.8: SEGGER_RTT_Write() parameter list	

Return value

>= 0 Number of bytes which have been sent.

Additional information

With SEGGER_RTT_Write() all kinds of data, not only printable one can be sent.

12.4.1.11SEGGER_RTT_WaitKey()

Description

Waits until at least one character is available in SEGGER RTT buffer 0. Once a character is available, it is read and returned.

Prototype

int SEGGER_RTT_WaitKey (void);

Return value

>= 0 Character which has been read (0 - 255).

Example

```
int c = 0;
do {
    c = SEGGER_RTT_WaitKey();
} while (c != 'c');
```

12.4.1.12SEGGER_RTT_WriteString()

Description

Write a 0-terminated string to an up channel via RTT.

Prototype

int SEGGER_RTT_WriteSting (unsigned BufferIndex, const char* s);

Parameters

Parameter	Meaning
BufferIndex	Index of the up channel to send string to.
S	Pointer to 0-terminated string to be sent.

Table 12.9: SEGGER_RTT_WriteString() parameter list

Return value

>= 0 Number of bytes which have been sent.

Example

SEGGER_RTT_WriteString(0, "Hello World from your target.\n");

12.4.2 Configuration defines

12.4.2.1 RTT configuration

SEGGER_RTT_MAX_NUM_DOWN_BUFFERS

Maximum number of down (to target) channels.

SEGGER_RTT_MAX_NUM_UP_BUFFERS

Maximum number of up (to host) cahnnels.

BUFFER_SIZE_DOWN

Size of the buffer for default down channel 0.

BUFFER_SIZE_UP

Size of the buffer for default up channel 0.

SEGGER_RTT_PRINT_BUFFER_SIZE

Size of the buffer for SEGGER_RTT_printf to bulk-send chars.

SEGGER_RTT_LOCK()

Locking routine to prevent interrupts and task switches from within an RTT operation.

SEGGER_RTT_UNLOCK()

Unlocking routine to allow interrupts and task switches after an RTT operation.

SEGGER_RTT_IN_RAM

Indicate the whole application is in RAM to prevent falsly identifying the RTT Control Block in the init segment by defining as 1.

12.4.2.2 Channel buffer configuration

SEGGER_RTT_MODE_BLOCK_IF_FIFO_FULL

SEGGER_RTT_NO_BLOCK_SKIP

SEGGER_RTT_NO_BLOCK_TRIM

12.4.2.3 Color control sequences

RTT_CTRL_RESET

Reset the text color and background color.

RTT_CTRL_TEXT_*

Set the text color to one of the following colors.

- BLACK
- RED
- GREEN
- YELLOW
- BLUE
- MAGENTA
- CYAN
- WHITE (light grey)
- BRIGHT_BLACK (dark grey)
 BRICHT_BED
- BRIGHT_RED

- BRIGHT_GREEN •

12.5 ARM Cortex - Background memory access

On ARM Cortex targets, background memory access necessary for RTT is performed via a so-called AHB-AP which is similar to a DMA but exclusively accessible by the debug probe. While on Cortex-M targets there is always an AHB-AP present, on Cortex-A and Cortex-R targets this is an optional component. CortexA/R targets may implement multiple APs (some even not an AHB-AP at all), so in order to use RTT on Cortex-A/R targets, the index of the AP which is the AHB-AP that shall be used for RTT background memory access, needs to be manually specified. This is done via the following J-Link Command string: *CORESIGHT_SetIndexAHBAPToUse* on page 225. For more information about how to use J-Link command strings in various environments, please refer to *Using command strings* on page 241.

12.6 Example code

    Cnt = 0;
  }
   _Delay(100);
  Cnt++;
 } while (1);
 return 0;
}
```

12.7 FAQ

- Q: How does J-Link find the RTT buffer?
- A: There are two ways: If the debugger (IDE) knows the address of the SEGGER RTT Control Block, it can pass it to J-Link. This is for example done by J-Link Debugger. If another application that is not SEGGER RTT aware is used, then J-Link searches for the ID in the known target RAM during execution of the application in the background. This process normally takes just fractions of a second and does not delay program execution.
- Q: I am debugging a RAM-only application. J-Link finds an RTT buffer, but I get no output. What can I do?
- A: In case the init section of an application is stored in RAM, J-Link migh falsely identify the block in the init section instead of the actual one in the data section. To prevent this, set the define SEGGER_RTT_IN_RAM to 1. Now J-Link will find the correct RTT buffer, but only after calling the first SEGGER_RTT function in the application. A call to SEGGER_RTT_Init() at the beginning of the application is recommended.
- Q: Can this also be used on targets that do not have the SWO pin?
- A: Yes, the debug interface is used. This can be JTAG or SWD (2pins only!) on most Cortex-M devices, or even the FINE interface on some Renesas devices, just like the Infineon SPD interface (single pin!).
- Q: Can this also be used on Cortex-M0 and M0+?
- A: Yes.
- Q: Some terminal output (printf) Solutions "crash" program execution when executed outside of the debug environment, because they use a Software breakpoint that triggers a hardfault without debugger or halt because SWO is not initialized. That makes it impossible to run a Debug-build in stand-alone mode. What about SEGGER-RTT?
- A: SEGGER-RTT uses non-blocking mode per default, which means it does not halt program execution if no debugger is present and J-Link is not even connected. The application program will continue to work.
- Q: I do not see any output, although the use of RTT in my application is correct. What can I do?
- A: In some cases J-Link cannot locate the RTT buffer in the known RAM region. In this case the possible region or the exact address can be set manually via a J-Link exec command:
 - Set ranges to be searched for RTT buffer: SetRTTSearchRanges <RangeStart [Hex]> <RangeSize >[, <Range1Start [Hex]> <Range1Size>, ...] (e.g. "SetRTT-SearchRanges 0x1000000 0x1000, 0x2000000 0x1000")
 - Set address of the RTT buffer: SetRTTAddr <RTTBufferAddress [Hex]> (e.g. "Set-RTTAddr 0x20000000")
 - Set address of the RTT buffer via J-Link Control Panel -> RTTerminal

Note: J-Link exec commands can be executed in most applications, for example in J-Link Commander via "exec <Command>", in J-Link GDB Server via "monitor exec <Command>" or in IAR EW via "__jlinkExecCommand("<Command>");" from a macro file.

Chapter 13 Device specifics

This chapter describes for which devices some special handling is necessary to use them with J-Link.

13.1 Analog Devices

J-Link has been tested with the following MCUs from Analog Devices:

- AD7160
- ADuC7020x62
- ADuC7021x32
- ADuC7021x62
- ADuC7022x32
- ADuC7022x62
- ADuC7024x62
- ADuC7025x32
- ADuC7025x62
- ADuC7026x62
- ADuC7027x62
- ADuC7028x62
- ADuC7030
- ADuC7031
- ADuC7032
- ADuC7033
- ADuC7034
- ADuC7036
- ADuC7038
- ADuC7039
- ADuC7060
- ADuC7061
- ADuC7062
- ADuC7128
- ADuC7129
- ADuC7229x126
- ADuCRF02
- ADuCRF101

13.1.1 ADuC7xxx

13.1.1.1 Software reset

A special reset strategy has been implemented for Analog Devices ADuC7xxx MCUs. This special reset strategy is a software reset. "Software reset" means basically RESET pin is used to perform the reset, the reset is initiated by writing special function registers via software.

The software reset for Analog Devices ADuC7xxxx executes the following sequence:

- The CPU is halted
- A software reset sequence is downloaded to RAM.
- A breakpoint at address 0 is set
- The software reset sequence is executed.

It is recommended to use this reset strategy. This sequence performs a reset of CPU and peripherals and halts the CPU before executing instructions of the user program. It is the recommended reset sequence for Analog Devices ADuC7xxx MCUs and works with these devices only.

This information is applicable to the following devices:

- Analog ADuC7020x62
- Analog ADuC7021x32
- Analog ADuC7021x62
- Analog ADuC7022x32
- Analog ADuC7022x62
- Analog ADuC7024x62
- Analog ADuC7025x32
- Analog ADuC7025x62

- Analog ADuC7026x62
- Analog ADuC7027x62
- Analog ADuC7030
- Analog ADuC7031
- Analog ADuC7032
- Analog ADuC7033
- Analog ADuC7128
- Analog ADuC7129
- Analog ADuC7229x126

13.2 **ATMEL**

J-Link has been tested with the following ATMEL devices:

- AT91SAM3A2C
- AT91SAM3A4C
- AT91SAM3A8C
- AT91SAM3N1A
- AT91SAM3N1B
- AT91SAM3N1C
- AT91SAM3N2A
- AT91SAM3N2B
- AT91SAM3N2C
- AT91SAM3N4A
- AT91SAM3N4B
- AT91SAM3N4C
- AT91SAM3S1A
- AT91SAM3S1B
- AT91SAM3S1C
- AT91SAM3S2A
- AT91SAM3S2B
- AT91SAM3S2C
- AT91SAM3S4A
- AT91SAM3S4B
- AT91SAM3S4C
- AT91SAM3U1C
- AT91SAM3U2C
- AT91SAM3U4C
- AT91SAM3U1E
- AT91SAM3U2E
- AT91SAM3U4E
- AT91SAM3X2C
- AT91SAM3X2E
- AT91SAM3X2G
- AT91SAM3X2H
- AT91SAM3X4C
- AT91SAM3X4E
- AT91SAM3X4G
- AT91SAM3X4H
- AT91SAM3X8C
- AT91SAM3X8E
- AT91SAM3X8G
- AT91SAM3X8H
- AT91SAM7A3
- AT91SAM7L64
- AT91SAM7L128
- AT91SAM7S16
- AT91SAM7S161
- AT91SAM7S32
- AT91SAM7S321
- AT91SAM7S64
- AT91SAM7S128
- AT91SAM7S256
- AT91SAM7S512
- AT91SAM7SE32
- AT91SAM7SE256
- AT91SAM7SE512
- AT91SAM7X128
- AT91SAM7X256
- AT91SAM7X512
- AT91SAM7XC128
- AT91SAM7XC256

- AT91SAM7XC512
- AT91SAM9XE128
- AT91SAM9XE256

13.2.1 AT91SAM7

13.2.1.1 Reset strategy

The reset pin of the device is per default disabled. This means that the reset strategies which rely on the reset pin (low pulse on reset) do not work per default. For this reason a special reset strategy has been made available.

It is recommended to use this reset strategy. This special reset strategy resets the peripherals by writing to the RSTC_CR register. Resetting the peripherals puts all peripherals in the defined reset state. This includes memory mapping register, which means that after reset flash is mapped to address 0. It is also possible to achieve the same effect by writing 0x4 to the RSTC_CR register located at address 0xffffd00.

This information is applicable to the following devices:

- AT91SAM7S (all devices)
- AT91SAM7SE (all devices)
- AT91SAM7X (all devices)
- AT91SAM7XC (all devices)
- AT91SAM7A (all devices)

13.2.1.2 Memory mapping

Either flash or RAM can be mapped to address 0. After reset flash is mapped to address 0. In order to majlink_supported_devices.html RAM to address 0, a 1 can be written to the RSTC_CR register. Unfortunately, this remap register is a toggle register, which switches between RAM and flash every time bit zero is written.

In order to achieve a defined mapping, there are two options:

- 1. Use the software reset described above.
- 2. Test if RAM is located at 0 using multiple read/write operations and testing the results.

Clearly 1. is the easiest solution and is recommended.

This information is applicable to the following devices:

- AT91SAM7S (all devices)
- AT91SAM7SE (all devices)
- AT91SAM7X (all devices)
- AT91SAM7XC (all devices)
- AT91SAM7A (all devices)

13.2.1.3 Recommended init sequence

In order to work with an ATMEL AT91SAM7 device, it has to be initialized. The following paragraph describes the steps of an init sequence. An example for different software tools, such as J-Link GDB Server, IAR Workbench and RDI, is given.

- Set JTAG speed to 30kHz.
- Reset target.
- Perform peripheral reset.
- Disable watchdog.
- Initialize PLL.
- Use full JTAG speed.

Samples

GDB Sample

```
# connect to the J-Link gdb server
target remote localhost:2331
monitor flash device = AT91SAM7S256
monitor flash download = 1
monitor flash breakpoints = 1
# Set JTAG speed to 30 kHz
monitor endian little
monitor speed 30
# Reset the target
monitor reset 8
monitor sleep 10
# Perform peripheral reset
monitor long 0xFFFFD00 = 0xA5000004
monitor sleep 10
# Disable watchdog
monitor long 0xFFFFD44 = 0x00008000
monitor sleep 10
# Initialize PLL
monitor long 0xFFFFFC20 = 0x00000601
monitor sleep 10
monitor long 0xFFFFFC2C = 0x00480a0e
monitor sleep 10
monitor long 0xFFFFC30 = 0x00000007
monitor sleep 10
monitor long 0xFFFFF60 = 0x00480100
monitor sleep 100
monitor sleep 100
monitor speed 12000
break main
load
continue
```

IAR Sample

```
*
      _Init()
*
*/
Init() {
 __emulatorSpeed(30000);
                                            // Set JTAG speed to 30 kHz
 __writeMemory32(0xA5000004,0xFFFFFD00,"Memory");
                                            // Perform peripheral reset
 ___sleep(20000);
 __writeMemory32(0x00008000,0xFFFFFD44,"Memory");
                                            // Disable Watchdog
 ___sleep(20000);
 __writeMemory32(0x0000601,0xFFFFFC20,"Memory");
                                            // PLL
 ___sleep(20000);
 __writeMemory32(0x10191c05,0xFFFFFC2C,"Memory");
                                            // PLL
 ___sleep(20000);
 __writeMemory32(0x0000007,0xFFFFFC30,"Memory");
                                            // PLL
 ___sleep(20000);
 __writeMemory32(0x002f0100,0xFFFFF60,"Memory");
                                            // Set 1 wait state for
  __sleep(20000);
                                            // flash (2 cycles)
                                            // Use full JTAG speed
  _emulatorSpeed(12000000);
}
*
*
      execUserReset()
* /
execUserReset() {
  __message "execUserReset()";
 _Init();
}
*
*
     execUserPreload()
*/
execUserPreload() {
  _message "execUserPreload()";
 _Init();
}
```

RDI Sample

SetJTAGSpeed(30); Reset(0, 0); Write32(0xFFFFFD00, 0xA5000004); // Perform peripheral reset Write32(0xFFFFFD44, 0x00008000); // Disable watchdog Write32(0xFFFFFC20, 0x00000601); // Set PLL Delay(200); Write32(0xFFFFFC2C, 0x00191C05); Write32(0xFFFFFC30, 0x00000007); // Select master clock and processor clock
Write32(0xFFFFFF60, 0x00320300); // Set flash wait states SetJTAGSpeed(12000);

- // Set JTAG speed to 30 kHz // Set PLL and divider

13.2.2 AT91SAM9

13.2.2.1 JTAG settings

We recommend using adaptive clocking.

This information is applicable to the following devices:

- AT91RM9200 •
- AT91SAM9260 •
- AT91SAM9261 •
- AT91SAM9262 •
- AT91SAM9263 •

13.3 DSPGroup

J-Link has been tested with the following DSPGroup devices:

• DA56KLF

13.4 Ember

For more information, please refer to *Silicon Labs* on page 387.

13.5 Energy Micro

For more information, please refer to *Silicon Labs* on page 387.

13.6 Freescale

J-Link has been tested with the following Freescale devices:

- MAC7101
- MAC7106
- MAC7111
- MAC7112
- MAC7116
- MAC7121
- MAC7122
- MAC7126

13.6.1 Kinetis family

13.6.1.1 Unlocking

If your device has been locked by setting the MCU security status to "secure", and mass erase via debug interface is not disabled, J-Link is able to unlock your Kinetis K40/K60 device. The device can be unlocked by using the "unlock" command in J-Link Commander.

For more information regarding the MCU security status of the Kinetis devices, please refer to the user manual of your device.

13.6.1.2 Tracing

The first silicon of the Kinetis devices did not match the data setup and hold times which are necessary for ETM-Trace. On these devices, a low drive strength should be configured for the trace clock pin in order to match the timing requirements.

On later silicons, this has been corrected. This bug applies to all devices with mask 0M33Z from the 100MHz series.

The J-Link software and documentation package comes with a sample project for the Kinetis K40 and K60 devices which is pre-configured for the TWR-40 and TWR-60 eval boards and ETM / ETB Trace. This sample project can be found at SamplesJLinkProjects.

13.6.1.3 Data flash support

Some devices of the Kinetis family have an additional area called FlexNVM, which can be configured as data flash. The size of the FlexNVM to be used as data flash is configurable and needs to be configured first, before this area can be used as data flash.

The sample below shows how to configure the FlexNVM area to be used as data flash out of the target application.

For J-Flash there are also projects that are preconfigured to setup the data flash size of a Kinetis device. The projects can be found at *\$JLINK_INST_DIR\$\Sam*ples\JFlash\ProjectFiles. One of these sample projects is the MK40DX256xxx10_ConfigureDataFlash.jflash.

For more information about how configuration of the data flash works, please refer to the appropriate user manual of the device.

Configure FlexNVM area as data flash

The follwing sample configures the data flash size of Kinetis device. It is created for a MK40DX256xxx10 device. The sequence is almost the same for all Kinetis devices only the lines which configure size of the data flash may be modified. In this sample the data flash is set to max size. EEPROM size is set to 0 bytes.

- LM3S6952 .
- LM3S6965 .

13.10.1 Unlocking LM3Sxxx devices

If your device has been "locked" accidentially (e.g. by bad application code in flash which mis-configures the PLL) and J-Link can not identify it anymore, there is a special unlock sequence which erases the flash memory of the device, even if it cannot be identified. This unlock sequence can be sent to the target, by using the "unlock" command in J-Link Commander.

13.11 NXP

J-Link has been tested with the following NXP devices:

- LPC1111
- LPC1113
- LPC1311
- LPC1313
- LPC1342
- LPC1343
- LPC1751
- LPC1751
- LPC1752
- LPC1754
- LPC1756
- LPC1758LPC1764
- LPC1764
 LPC1765
- LPC1766
- LPC1768
- LPC2101
- LPC2102
- LPC2103
- LPC2104
- LPC2105
- LPC2106

- SJA2010
- SJA2510

13.11.1 LPC ARM7-based devices

13.11.1.1Fast GPIO bug

The values of the fast GPIO registers cannot be read directly via JTAG from a debugger. The direct access to the registers corrupts the returned values. This means that the values in the fast GPIO registers normally cannot be checked or changed by a debugger.

Solution / Workaround

J-Link supports command strings which can be used to read a memory area indirectly. Indirect reading means that a small code snippet will be written into RAM of the target device, which reads and transfers the data of the specified memory area to the debugger. Indirect reading solves the fast GPIO problem, because only direct register access corrupts the register contents.

Define a 256 byte aligned area in RAM of the LPC target device with the J-Link command map ram and define afterwards the memory area which should be read indirect with the command map indirectread to use the indirectly reading feature of J-Link. Note that the data in the defined RAM area is saved and will be restored after using the RAM area.

This information is applicable to the following devices:

- LPC2101
- LPC2102
- LPC2103
- LPC213x/01
- LPC214x (all devices)
- LPC23xx (all devices)
- LPC24xx (all devices)

Example

J-Link commands line options can be used for example with the C-SPY debugger of the IAR Embedded Workbench. Open the **Project options** dialog and select **Debug-ger**. Select **Use command line options** in the **Extra Options** tap and enter in the textfield --jlink_exec_command "map ram 0x4000000-0x40003fff; map indirectread 0x3fffc000-0x3fffcfff; map exclude 0x3fffd000-0x3ffffff;" as shown in the screenshot below.

Options for node "Proj Category:	ect" ×
General Options C/C++ Compiler Assembler Custom Build Build Actions Linker Debugger Simulator Angel IAR ROM-monitor J-Link/J-Trace LMI FTDI Macraigor RDI Third-Party Driver	Setup Download Extra Options Plugins Command line options: Command line options: (one per line) flink_exec_command "map ram 0x40000000-0x40003fff; map indire
	OK Cancel

With these additional commands the values of the fast GPIO registers in the C-SPY debugger are correct and can be used for debugging. For more information about J-Link command line options refer to subchapter *Command strings* on page 223.

13.11.1.2RDI

J-Link comes with a device-based RDI license for NXP LPC21xx-LPC24xx devices. This means the J-Link RDI software can be used with LPC21xx-LPC24xx devices free of charge. For more information about device-based licenses, please refer to *License types* on page 69.

13.11.2 Reset (Cortex-M3 based devices)

For Cortex-M3 based NXP LPC devices the reset itself does not differ from the one for other Cortex-M3 based devices: After the device has been reset, the core is halted before any instruction is performed. For the Cortex-M3 based LPC devices this means the CPU is halted before the bootloader which is mapped at address 0 after reset.

The user should write the memmap register after reset, to ensure that user flash is mapped at address 0. Moreover, the user have to correct the Stack pointer (R13) and the PC (R15) manually, after reset in order to debug the application.

13.11.3 LPC288x flash programming

In order to use the LPC288x devices in combination with the J-Link flash download feature, the application you are trying to debug, should be linked to the original flash (a) addr 0x10400000. Otherwise it is user's responsibility to ensure that flash is remapped to 0x0 in order to debug the application from addr 0x0.

13.11.4 LPC43xx:

All devices of the LPC43xx are dual core devices (One Cortex-M4 core and one Cortex-M0 core). For these devices, a J-Link script file is needed (exact file depends on if the Cortex-M4 or the Cortex-M0 shall be debugged) in order to guarantee proper functionality.

Script file can be found at \$JLINK_INST_DIR\$\Samples\JLink\Scripts

For more information about how to use J-Link script files, please refer to *Executing J-Link script files* on page 220.

13.12 OKI

J-Link has been tested with the following OKI devices:

- ML67Q4002
- ML67Q4003
- ML67Q4050
- ML67Q4051
- ML67Q4060
- ML67Q4061

13.13 Renesas

J-Link has been tested with the following Renesas devices:

- R5F56104
- R5F56106
- R5F56107
- R5F56108
- R5F56216
- R5F56217
- R5F56218
- R5F562N7
- R5F562N8
- R5F562T6
- R5F562T7
- R5F562TA

13.14 Samsung

J-Link has been tested with the following Samsung devices:

• S3FN60D

13.14.1 S3FN60D

On the S3FN60D the watchdog may be running after reset (depends on the content of the smart option bytes at addr. 0xC0). The watchdog keeps counting even if the CPU is in debug mode (e.g. halted). So, please do not use the watchdog when debugging to avoid unexpected behavior of the target application. A special reset strategy has been implemented for this device which disables the watchdog right after a reset has been performed. We recommend to use this reset strategy when debugging a Samsung S3FN60D device.

13.15 Silicon Labs

J-Link has been tested with the following Silicon Labs devices:

- EFM32G200F16
- EFM32G200F32
- EFM32G200F64
- EFM32G210F128
- EFM32G230F32
- EFM32G230F64
- EFM32G230F128
- EFM32G280F32
- EFM32G280F64
- EFM32G280F128
- EFM32G290F32
- EFM32G290F64
- EFM32G290F128
- EFM32G840F32
- EFM32G840F64
- EFM32G840F128
- EFM32G880F32
- EFM32G880F64
- EFM32G880F128
- EFM32G890F32
- EFM32G890F64
- EFM32G890F128
- EFM32TG108F4
- EFM32TG108F8
- EFM32TG108F16
- EFM32TG108F32
- EFM32TG110F4
- EFM32TG110F8
- EFM32TG110F16
- EFM32TG110F32
- EFM32TG210F8
- EFM32TG210F16
- EFM32TG210F32
- EFM32TG230F8
- EFM32TG230F16
- EFM32TG230F32
- EFM32TG840F8
- EFM32TG840F16
- EFM32TG840F32
- EM351
- EM357

13.15.1 EFM32 series devices

13.15.1.1SWO

Usually, the SWO output frequency of a device is directly dependent on the CPU speed. The SWO speed is calculated as: <CPUFreq> / n. On the EFM32 series this is not the case:

The SWO related units (ITM, TPIU, ...) are chip-internally wired to a fixed 14 MHz clock (AUXHFRCO).

This will cause the auto-detection of J-Link to not work by default for these devices, if the CPU is running at a different speed than AUXHFRCO. All utilities that use SWO speed auto-detection, like the J-Link SWOViewer, need to be told that the CPU is running at 14 MHz, to make SWO speed auto-detection work, no matter what speed the CPU is really running at.

13.16 ST Microelectronics

J-Link has been tested with the following ST Microelectronics devices:

- STR710FZ1
- STR710FZ2
- STR711FR0
- STR711FR1
- STR711FR2
- STR712FR0
- STR712FR1
 STR712FR2
- STR712FR2
 STR715FR0
- STR713FR0

- STM32F101R8
- STM32F101RB
- STM32F101V8
- STM32F101VB
- STM32F103C6
- STM32F103C8
- STM32F103C0
 STM32F103R6
- STM32F103R8
- STM32F103RB
- STM32F103KB
 STM32F103V8
- STM32F103VB

13.16.1 STR91x

13.16.1.1JTAG settings

These device are ARM966E-S based. We recommend to use adaptive clocking for these devices.

13.16.1.2Unlocking

The devices have 3 TAP controllers built-in. When starting J-Link.exe, it reports 3 JTAG devices. A special tool, J-Link STR9 Commander (JLinkSTR91x.exe) is available to directly access the flash controller of the device. This tool can be used to erase the flash of the controller even if a program is in flash which causes the ARM core to stall. For more information about the J-Link STR9 Commander, please refer to *J-Link STR91x Commander (Command line tool)* on page 152.

When starting the STR91x commander, a command sequence will be performed which brings MCU into Turbo Mode.

"While enabling the Turbo Mode, a dedicated test mode signal is set and controls the GPIOs in output. The IOs are maintained in this state until a next JTAG instruction is sent." (ST Microelectronics)

Enabling Turbo Mode is necessary to guarantee proper function of all commands in the STR91x Commander.

13.16.1.3Switching the boot bank

The bootbank of the STR91x devices can be switched by using the J-Link STR9 Commander which is part of the J-Link software and documentation package. For more information about the J-Link STR9 Commander, please refer to *J-Link STR91x Commander (Command line tool)* on page 152.

13.16.2 STM32F10xxx

These devices are Cortex-M3 based. All devices of this family are supported by J-Link.

13.16.2.1ETM init

The following sequence can be used to prepare STM32F10xxx devices for 4-bit ETM tracing:

```
int v;
//
// DBGMCU_CR, enable trace I/O and configure pins for 4-bit trace.
//
v = *((volatile int *)(0xE0042004));
v &= ~(7 << 5); // Preserve all bits except the trace pin configuration
v |= (7 << 5); // Enable trace I/O and configure pins for 4-bit trace
*((volatile int *)(0xE0042004)) = v;</pre>
```

13.16.2.2 Option byte programming

J-Flash supports programming of the option bytes for STM32 devices. In order to program the option bytes simply choose the appropriate Device, which allows option byte programming, in the CPU settings tab (e.g. **STM32F103ZE** (allow opt. bytes)). J-Flash will allow programming a virtual 16-byte sector at address

0x06000000 which represents the 8 option bytes and their complements. You do not have to care about the option bytes' complements since they are computated automatically. The following table describes the structure of the option bytes sector:

Address	[31:24]	[23:16]	[15:8]	[7:0]
0x06000000	complement	Option byte 1	complement	Option byte 0
0x06000004	complement	Option byte 3	complement	Option byte 2
0x06000008	complement	Option byte 5	complement	Option byte 4
0x0600000C	complement	Option byte 7	complement	Option byte 6

 Table 13.1: Option bytes sector description

Note: Writing a value of 0xFF inside option byte 0 will read-protect the STM32. In order to keep the device unprotected you have to write the key value 0xA5 into option byte 0.

Note: The address 0x06000000 is a virtual address only. The option bytes are originally located at address 0x1FFFF800. The remap from 0x06000000 to 0x1FFFF800 is done automatically by J-Flash.

Example

To program the option bytes 2 and 3 with the values 0xAA and 0xBB, but leave the device unprotected your option byte sector (at addr 0x06000000) should look like as follows:

Address	[31:24]	[23:16]	[15:8]	[7:0]
0x06000000	0x00	0xFF	0x5A	0xA5
0x06000004	0x44	0xBB	0x55	0xAA
0x06000008	0x00	0xFF	0x00	0xFF
0x0600000C	0x00	0xFF	0x00	0xFF

Table 13.2: Option bytes programming example

For a detailed description of each option byte, please refer to *ST programming manual PM0042, section "Option byte description".*

13.16.2.3Securing/unsecuring the device

The user area internal flash of the STM32 devices can be protected (secured) against read by untrusted code. The J-Flash software allows securing a STM32F10x device. For more information about J-Flash, please refer to *UM08003*, *J-Flash User Guide*. In order to unsecure a read-protected STM32F10x device, SEGGER offers two software components:

- J-Flash
- J-Link STM32 Commander (command line utility)

For more information about J-Flash, please refer to UM08003, J-Flash User Guide. For more information about the J-Link STM32 Commander, please refer to J-Link STM32 Unlock (Command line tool) on page 153.

Note: Unsecuring a secured device will cause a mass-erase of the internal flash memory.

13.16.2.4Hardware watchdog

The hardware watchdog of a STM32F10x device can be enabled by programming the option bytes. If the hardware watchdog is enabled the device is reset periodically if the watchdog timer is not refreshed and reaches 0. If the hardware watchdog is enabled by an application which is located in flash and which does not refresh the watchdog timer, the device can not be debugged anymore.

In order to disable the hardware watchdog the option bytes have to be re-programmed. SEGGER offers a free command line tool which reprograms the option bytes in order to disable the hardware watchdog. For more information about the STM32 commander, please refer to *J-Link STM32 Unlock (Command line tool)* on page 153.

13.16.2.5Debugging with software watchdog enabled

If the device shall be debugged with one of the software watchdogs (independed watchdog / window watchdog) enabled, there is an additional init step necessary to make the watchdog counter stop when the CPU is halted by the debugger. This is configured in the DBGMCU_CR register. The following sequence can be used to enable debugging with software watchdogs enabled:

```
//
// Configure both watchdog timers to be halted if the CPU is halted by the debugger
//
*((volatile int *)(0xE0042004)) |= (1 << 8) | (1 << 9);</pre>
```

13.16.3 STM32F2xxx

These devices are Cortex-M3 based. All devices of this family are supported by J-Link.

13.16.3.1ETM init

The following sequence can be used to prepare STM32F2xxx devices for 4-bit ETM tracing:

```
int v;
//
// Enable GPIOE clock
11
*((volatile int *)(0x40023830)) = 0x00000010;
11
// Assign trace pins to alternate function in order
// to make them usable as trace pins
// PE2: Trace clock
// PE3: TRACE_D0
// PE4: TRACE_D1
// PE5: TRACE_D2
// PE6: TRACE_D3
11
*((volatile int *)(0x40021000)) = 0x00002AA0;
11
// DBGMCU_CR, enable trace I/O and configure pins for 4-bit trace.
11
v = *((volatile int *)(0xE0042004));
v &= \sim(7 << 5); // Preserve all bits except the trace pin configuration v |= (7 << 5); // Enable trace I/O and configure pins for 4-bit trace *((volatile int *)(0xE0042004)) = v;
```

13.16.3.2Debugging with software watchdog enabled

If the device shall be debugged with one of the software watchdogs (independed watchdog / window watchdog) enabled, there is an additional init step necessary to make the watchdog counter stop when the CPU is halted by the debugger. This is configured in the DBGMCU_APB1_FZ register. The following sequence can be used to enable debugging with software watchdogs enabled:

```
//
// Configure both watchdog timers to be halted if the CPU is halted by the debugger
//
*((volatile int *)(0xE0042008)) |= (1 << 11) | (1 << 12);</pre>
```

13.16.4 STM32F4xxx

These devices are Cortex-M4 based. All devices of this family are supported by J-Link.

13.16.4.1ETM init

The following sequence can be used to prepare STM32F4xxx devices for 4-bit ETM tracing:

```
int v;
//
// Enable GPIOE clock
//
*((volatile int *)(0x40023830)) = 0x00000010;
//
// Assign trace pins to alternate function in order
// to make them usable as trace pins
// PE2: Trace clock
// PE3: TRACE_D0
// PE4: TRACE_D1
// PE5: TRACE_D2
// PE6: TRACE_D3
//
*((volatile int *)(0x40021000)) = 0x00002AA0;
//
*((volatile int *)(0x40021000)) = 0x00002AA0;
//
v = *((volatile int *)(0x40021000)) = 0x00002AA0;
//
v = *((volatile int *)(0x40021000)) = 0x00002AA0;
//
v = *((volatile int *)(0xE0042004));
v &= ~(7 << 5); // Preserve all bits except the trace pin configuration
v |= (7 << 5); // Enable trace I/O and configure pins for 4-bit trace
*((volatile int *)(0xE0042004)) = v;
```

13.16.4.2Debugging with software watchdog enabled

If the device shall be debugged with one of the software watchdogs (independed watchdog / window watchdog) enabled, there is an additional init step necessary to make the watchdog counter stop when the CPU is halted by the debugger. This is configured in the DBGMCU_APB1_FZ register. The following sequence can be used to enable debugging with software watchdogs enabled:

```
// Configure both watchdog timers to be halted if the CPU is halted by the debugger
//
*((volatile int *)(0xE0042008)) |= (1 << 11) | (1 << 12);</pre>
```

13.17 Texas Instruments

J-Link has been tested with the following Texas Instruments devices:

- AM3352
- AM3354
- AM3356
- AM3357
- AM3358
- AM3359
- OMAP3530
- OMAP3550
- OMAP4430
- OMAP-L138
- TMS470M
- TMS470R1A64
- TMS470R1A128
- TMS470R1A256
- TMS470R1A288
- TMS470R1A384
- TMS470R1B512
- TMS470R1B768
- TMS470R1B1M
- TMS470R1VF288
- TMS470R1VF688
- TMS470R1VF689

13.17.1 AM335x

The AM335x series devices need some special handling which requires the correct device is selected in the J-Link DLL. When used out of a debugger, this is usually done automatically (see *Software reset* on page 364). For J-Link Commander & J-Link GDBServer this needs to be done manually.

13.17.1.1Selecting the device in the IDE

When using J-Link in an IDE, there is usually a way to directly select the device in the IDE, since it usually also needs this information for peripheral register view etc. The selected device is then usually automatically passed to the J-Link DLL.

The screenshot below is an example for a device selection inside emIDE (http://www.emide.org).

Project/targets op	tions				
Project settings	Build targets Build sc	ripts Notes C/C+-	+ parser options De	bugger	
Select target:	JLink GDBServer		-		
Debug Release	Target Device:	AM3359	Little Endian 🛛 🔻	Device list	
	Target Connection:	SWD 🔻	4000 🗸	kHz	
	IP Address:	localhost	2331		
	Override register definition Debugger Start the applicat GDB commands after monitor reset load	ion 🛛 Run to main	0		
					OK Cancel

13.17.1.2Selecting the device when using GDBServer

When using the J-Link GDBServer, the device needs to be known **before** GDB connects to the GDBServer since GDBServer connects to the device as soon as it is started. So selecting the device via monitor command is too late. In order to select the device before GDBServer connects to it, simply start it with the following command line:

-device <DeviceName> Example: JLinkGDBServer -device AM3359

13.17.1.3Selecting the device when using J-Link Commander

For J-Link Commander, type:

device <DeviceName>

Then J-Link Commander will perform a reconnect with the device name selected before.

13.17.1.4Known values for <DeviceName>

For a list of all supported devices, please refer to http://www.segger.com/jlink_supported_devices.html

13.17.1.5Required J-Link hardware version

The special handling for the AM335x cannot be supported by some older hardware versions of J-Link, so the device cannot be used with these versions.

The following hardware versions come with AM335x support:

- J-Link V8 or later
- J-Link PRO V3 or later
- J-Link ULTRA V4 or later
- Flasher ARM V4 or later

13.17.2 AM35xx / AM37xx

Script is not needed. Refer to AM335x special handling. Same needs to be done for AM35xx / AM37xx.

13.17.3 OMAP4430

Script is not needed. Refer to AM335x special handling. Same needs to be done for AM35xx / AM37xx.

13.17.4 OMAP-L138

Needs a J-Link script file to guarantee proper functionality.

J-Link script file can be found at $JLINK_INST_DIRSSamples_JLinkScripts$.

For more information about how to use J-Link script files, please refer to *Executing J-Link script files* on page 220.

13.17.5 TMS470M

Needs a J-Link script file to guarantee proper functionality.

J-Link script file can be found at \$JLINK_INST_DIR\$\Samples\JLink\Scripts

For more information about how to use J-Link script files, please refer to *Executing J-Link script files* on page 220.

13.17.6 OMAP3530

Needs a J-Link script file to guarantee proper functionality.

J-Link script file can be found at \$JLINK_INST_DIR\$\Samples\JLink\Scripts

For more information about how to use J-Link script files, please refer to *Executing J-Link script files* on page 220.

13.17.7 OMAP3550

Needs a J-Link script file to guarantee proper functionality.

J-Link script file can be found at \$JLINK_INST_DIR\$\Samples\JLink\Scripts

For more information about how to use J-Link script files, please refer to *Executing J-Link script files* on page 220.

13.18 Toshiba

J-Link has been tested with the following Toshiba devices:

- TMPM321F10FG
- TMPM322F10FG
- TMPM323F10FG
- TMPM324F10FG
- TMPM330FDFG
- TMPM330FWFG
- TMPM330FYFG
- TMPM332FWUG

Chapter 14

Target interfaces and adapters

This chapter gives an overview about J-Link / J-Trace specific hardware details, such as the pinouts and available adapters.

14.1 20-pin J-Link connector

14.1.1 Pinout for JTAG

J-Link and J-Trace have a JTAG connector compatible to ARM's Multi-ICE. The JTAG connector is a 20 way Insulation Displacement Connector (IDC) keyed box header (2.54mm male) that mates with IDC sockets mounted on a ribbon cable.

*On later J-Link products like the J-link ULTRA, these pins are reserved for firmware extension purposes. They can be left open or connected to GND in normal debug environment. They are not essential for JTAG/SWD in general.

	1			

PIN	SIGNAL	TYPE	Description
1	VTref	Input	This is the target reference voltage. It is used to check if the target has power, to create the logic-level reference for the input comparators and to control the output logic levels to the target. It is normally fed from Vdd of the target board and must not have a series resistor.
2	Not con- nected	NC	This pin is not connected in J-Link.
3	nTRST	Output	JTAG Reset. Output from J-Link to the Reset signal of the target JTAG port. Typically connected to nTRST of the target CPU. This pin is normally pulled HIGH on the target to avoid unintentional resets when there is no connection.
5	TDI	Output	JTAG data input of target CPU. It is recommended that this pin is pulled to a defined state on the target board. Typically connected to TDI of the target CPU.
7	TMS	Output	JTAG mode set input of target CPU. This pin should be pulled up on the target. Typically connected to TMS of the target CPU.
9	тск	Output	JTAG clock signal to target CPU. It is recommended that this pin is pulled to a defined state of the target board. Typically connected to TCK of the target CPU.
11	RTCK	Input	Return test clock signal from the target. Some targets must synchronize the JTAG inputs to internal clocks. To assist in meeting this requirement, you can use a returned, and retimed, TCK to dynamically control the TCK rate. J-Link supports adaptive clocking, which waits for TCK changes to be echoed correctly before making further changes. Con- nect to RTCK if available, otherwise to GND.
13	TDO	Input	JTAG data output from target CPU. Typically connected to TDO of the target CPU.

The following table lists the J-Link / J-Trace JTAG pinout.

Table 14.1: J-Link / J-Trace pinout

PIN	SIGNAL	TYPE	Description
15	RESET	I/O	Target CPU reset signal. Typically connected to the RESET pin of the target CPU, which is typically called "nRST", "nRESET" or "RESET".
17	DBGRQ	NC	This pin is not connected in J-Link. It is reserved for com- patibility with other equipment to be used as a debug request signal to the target system. Typically connected to DBGRQ if available, otherwise left open.
19	5V-Sup- ply	Output	This pin can be used to supply power to the target hard- ware. Older J-Links may not be able to supply power on this pin. For more information about how to enable/disable the power supply, please refer to <i>Target power supply</i> on page 400.

Table 14.1: J-Link / J-Trace pinout

Pins 4, 6, 8, 10, 12, 14, 16, 18, 20 are GND pins connected to GND in J-Link. They should also be connected to GND in the target system.

14.1.1.1 Target board design

We strongly advise following the recommendations given by the chip manufacturer. These recommendations are normally in line with the recommendations given in the table *Pinout for JTAG* on page 398. In case of doubt you should follow the recommendations given by the semiconductor manufacturer.

You may take any female header following the specifications of DIN 41651. For example:

Harting	part-no. 09185206803
Molex	part-no. 90635-1202
Tyco Electronics	part-no. 2-215882-0

Typical target connection for JTAG

* NTRST and RTCK may not be available on some CPUs.

** Optional to supply the target board from J-Link.

14.1.1.2 Pull-up/pull-down resistors

Unless otherwise specified by developer's manual, pull-ups/pull-downs are recommended to 100 kOhms.

14.1.1.3 Target power supply

Pin 19 of the connector can be used to supply power to the target hardware. Supply voltage is 5V, max. current is 300mA. The output current is monitored and protected against overload and short-circuit. Power can be controlled via the J-Link commander. The following commands are available to control power:

Explanation
Switch target power on
Switch target power off
Set target power supply default to "on"
Set target power supply default to "off"

Table 14.2: Command List

14.1.2 Pinout for SWD

The J-Link and J-Trace JTAG connector is also compatible to ARM's Serial Wire Debug (SWD).

*On later J-Link products like the J-link ULTRA, these pins are reserved for firmware extension purposes. They can be left open or connected to GND in normal debug environment. They are not essential for JTAG/SWD in general.

	L			

The following table lists the J-Link / J-Trace SWD sipinout.

PIN	SIGNAL	TYPE	Description
1	VTref	Input	This is the target reference voltage. It is used to check if the target has power, to create the logic-level reference for the input comparators and to control the output logic levels to the target. It is normally fed from Vdd of the target board and must not have a series resistor.
2	Not con- nected	NC	This pin is not connected in J-Link.
3	Not Used	NC	This pin is not used by J-Link. If the device may also be accessed via JTAG, this pin may be connected to nTRST, otherwise leave open.
5	Not used	NC	This pin is not used by J-Link. If the device may also be accessed via JTAG, this pin may be connected to TDI, otherwise leave open.
7	SWDIO	I/O	Single bi-directional data pin. A pull-up resistor is required. ARM recommends 100 kOhms.
9	SWCLK	Output	Clock signal to target CPU. It is recommended that this pin is pulled to a defined state on the target board. Typically connected to TCK of target CPU.
11	Not used	NC	This pin is not used by J-Link when operating in SWD mode. If the device may also be accessed via JTAG, this pin may be connected to RTCK, otherwise leave open.
13	SWO	Input	Serial Wire Output trace port. (Optional, not required for SWD communication.)
15	RESET	I/O	Target CPU reset signal. Typically connected to the RESET pin of the target CPU, which is typically called "nRST", "nRESET" or "RESET".
17	Not used	NC	This pin is not connected in J-Link.
19	5V-Sup- ply	Output	power supply, please refer to <i>Target power supply</i> on page 402.

Table 14.3: J-Link / J-Trace SWD pinout

Pins 4, 6, 8, 10, 12, 14, 16, 18, 20 are GND pins connected to GND in J-Link. They should also be connected to GND in the target system.

14.1.2.1 Target board design

We strongly advise following the recommendations given by the chip manufacturer. These recommendations are normally in line with the recommendations given in the table *Pinout for SWD* on page 401. In case of doubt you should follow the recommendations given by the semiconductor manufacturer.

Typical target connection for SWD

* Optional to supply the target board from J-Link.

14.1.2.2 Pull-up/pull-down resistors

A pull-up resistor is required on SWDIO on the target board. ARM recommends 100 kOhms.

In case of doubt you should follow the recommendations given by the semiconductor manufacturer.

14.1.2.3 Target power supply

Pin 19 of the connector can be used to supply power to the target hardware. Supply voltage is 5V, max. current is 300mA. The output current is monitored and protected against overload and short-circuit.

Power can be controlled via the J-Link commander. The following commands are available to control power:

Command	Explanation
power on	Switch target power on
power off	Switch target power off
power on perm	Set target power supply default to "on"
power off perm	Set target power supply default to "off"

Table	14.4:	Command	List

14.1.3 Pinout for SWD + Virtual COM Port (VCOM)

The J-Link and J-Trace JTAG connector is also compatible to ARM's Serial Wire Debug (SWD).

*On later J-Link products like the J-link ULTRA, J. these pins are reserved for firmware extension s purposes. They can be left open or connected to S GND in normal debug environment. They are not N essential for JTAG/SWD in general.

The following table lists the J-Link / J-Trace SWD j pinout.

PIN	SIGNAL	TYPE	Description
1	VTref	Input	This is the target reference voltage. It is used to check if the target has power, to create the logic-level reference for the input comparators and to control the output logic levels to the target. It is normally fed from Vdd of the target board and must not have a series resistor.
2	Not con- nected	NC	This pin is not connected in J-Link.
3	Not Used	NC	This pin is not used by J-Link. If the device may also be accessed via JTAG, this pin may be connected to nTRST, otherwise leave open.
5	J-Link Tx	Output	This pin is used as VCOM Tx (out on J-Link side) in case VCOM functionality of J-Link is enabled. For further information about VCOM, please refer to <i>Virtual COM Port (VCOM)</i> on page 245.
7	SWDIO	I/O	Single bi-directional data pin. A pull-up resistor is required. ARM recommends 100 kOhms.
9	SWCLK	Output	Clock signal to target CPU. It is recommended that this pin is pulled to a defined state on the target board. Typically connected to TCK of target CPU.
11	Not used	NC	This pin is not used by J-Link when operating in SWD mode. If the device may also be accessed via JTAG, this pin may be connected to RTCK, otherwise leave open.
13	SWO	Input	Serial Wire Output trace port. (Optional, not required for SWD communication.)
15	RESET	I/O	Target CPU reset signal. Typically connected to the RESET pin of the target CPU, which is typically called "nRST", "nRESET" or "RESET".
17	J-Link Rx	input	This pin is used as VCOM Rx (in on J-Link side) in case VCOM functionality of J-Link is enabled. For further information, please refer to <i>Virtual COM Port (VCOM)</i> on page 245.
19 Table	5V-Sup- ply 14.5: J-Link ,	Output	power supply, please refer to <i>Target power supply</i> on page 402.

Table 14.5: J-Link / J-Trace SWD pinout

Pins 4, 6, 8, 10, 12, 14, 16, 18, 20 are GND pins connected to GND in J-Link. They should also be connected to GND in the target system.

14.1.4 Pinout for SPI

*On later J-Link products like the J-link ULTRA, these pins are reserved for firmware extension purposes. They can be left open or connected to GND in normal debug environment.

					n

The following table lists the pinout for the SPI inter- **5** face on J-Link.

PIN	SIGNAL	ТҮРЕ	Description		
1	VTref	Input	This is the target reference voltage. It is used to check if the target has power, to create the logic-level reference for the input comparators and to control the output logic levels to the target. It is normally fed from Vdd of the target board and must not have a series resistor.		
2	Not con- nected	NC	Leave open on target side		
3	Not con- nected	NC	Leave open on target side		
5	DI	Output	Data-input of target SPI. Output of J-Link, used to transmit data to the target SPI.		
7	nCS	Output	Chip-select of target SPI (active LOW).		
9	CLK	Output	SPI clock signal.		
11	Not con- nected	NC	Leave open on target side		
13	DO	Input	Data-out of target SPI. Input of J-Link, used to receive data from the target SPI.		
15	RESET	I/O	Target CPU reset signal. Typically connected to the RESET pin of the target CPU, which is typically called "nRST", "nRESET" or "RESET".		
17	Not con- nected	NC	Leave open on target side		
19	5V-Sup- ply	Output	This pin can be used to supply power to the target hard- ware. Older J-Links may not be able to supply power on this pin. For more information about how to enable/disable the power supply, please refer to <i>Target power supply</i> on page 400.		

Table 14.6: J-Link / J-Trace pinout

Pins 4, 6, 8, 10, 12 are GND pins connected to GND in J-Link. They should also be connected to GND in the target system.

14.2 38-pin Mictor JTAG and Trace connector

J-Trace provides a JTAG+Trace connector. This connector is a 38-pin mictor plug. It connects to the target via a 1-1 cable.

The connector on the target board should be "TYCO type 5767054-1" or a compatible receptacle. J-Trace supports 4, 8, and 16-bit data port widths with the high density target connector described below.

Target board trace connector

J-Trace can capture the state of signals PIPESTAT[2:0], TRACESYNC and TRACEPKT[n:0] at each rising edge of each TRACECLK or on each alternate rising or falling edge.

14.2.1 Connecting the target board

J-Trace connects to the target board via a 38-pin trace cable. This cable has a receptacle on the one side, and a plug on the other side. Alternatively J-Trace can be connected with a 20-pin JTAG cable.

Warning: Never connect trace cable and JTAG cable at the same time because this may harm your J-Trace and/or your target.

14.2.2 Pinout

The following table lists the JTAG+Trace connector pinout. It is compatible to the "Trace Port Physical Interface" described in [ETM], 8.2.2 "Single target connector pinout".

1 NC Not connected. 2 NC Not connected. 3 NC Not connected. 4 NC Not connected. 5 GND Signal ground. 6 TRACECLK Clocks trace data on rising edge or both edges. 7 DBGRQ Debug request. 8 DBGACK Debug acknowledge from the test chip, high when in debug state. 9 RESET Open-collector output from the run control to the target system reset. 10 EXTTRIG Optional external trigger signal to the Embedded trace Macrocell (ETM). Not used. Leave open on target system. 11 TDO Test data output from target JTAG port. 12 VTRef Signal level reference. It is normally fed from Vdd of the target board and must not have a series resistor. 13 RTCK Return test clock from the target JTAG port. 14 VSupply Supply voltage. Table 14.8: Assignment of trace information pins between ETM architecture versions

14.2.4 Trace signals

Data transfer is synchronized by TRACECLK.

14.2.4.1 Signal levels

The maximum capacitance presented by J-Trace at the trace port connector, including the connector and interfacing logic, is less than 6pF. The trace port lines have a matched impedance of 50.

The J-Trace unit will operate with a target board that has a supply voltage range of 3.0V-3.6V.

14.2.4.2 Clock frequency

For capturing trace port signals synchronous to TRACECLK, J-Trace supports a TRACECLK frequency of up to 200MHz. The following table shows the TRACECLK frequencies and the setup and hold timing of the trace signals with respect to TRACE-CLK.

Parameter	Min.	Max.	Explanation
Tperiod	5ns	1000ns	Clock period
Fmax	1MHz	200MHz	Maximum trace frequency
Tch	2.5ns	-	High pulse width
Tcl	2.5ns	-	Low pulse width
Tsh	2.5ns	-	Data setup high

Table 14.9: Clock frequency

Parameter	Min.	Max.	Explanation
Thh	1.5ns	-	Data hold high
Tsl	2.5ns	-	Data setup low
ThI	1.5ns	-	Data hold low

Table 14.9: Clock frequency

The diagram below shows the TRACECLK frequencies and the setup and hold timing of the trace signals with respect to TRACECLK.

Note: J-Trace supports half-rate clocking mode. Data is output on each edge of the TRACECLK signal and TRACECLK (max) \leq 100MHz. For half-rate clocking, the setup and hold times at the JTAG+Trace connector must be observed.

14.3 19-pin JTAG/SWD and Trace connector

J-Trace provides a JTAG/SWD+Trace connector. This connector is a 19-pin connector. It connects to the target via an 1-1 cable.

VTref	1	•	•	2	SWDIO/TMS

		_	_		1

The following table lists the J-Link / J-Trace SWD pinout.

PIN	SIGNAL	TYPE	Description		
1	VTref	Input	This is the target reference voltage. It is used to check if the target has power, to create the logic-level reference for the input comparators and to control the output logic levels to the target. It is normally fed from Vdd of the target board and must not have a series resistor.		
2	SWDIO/ TMS	I/O / output	SWDIO: (Single) bi-directional data pin. JTAG mode set input of target CPU. This pin should be pulled up on the target. Typically connected to TMS of the target CPU.		
4	SWCLK/TCK	Output	SWCLK: Clock signal to target CPU. It is recommended that this pin is pulled to a defined state of the target board. Typically connected to TCK of target CPU. JTAG clock signal to target CPU.		
6	SWO/TDO	Input	JTAG data output from target CPU. Typically connected to TDO of the target CPU. When using SWD, this pin is used as Serial Wire Output trace port. (Optional, not required for SWD communica- tion)		
			This pin (normally pin 7) is not existent on the 19-pin JTAG/SWD and Trace connector.		
8	TDI	Output	JTAG data input of target CPU. It is recommended that this pin is pulled to a defined state on the target board. Typically connected to TDI of the target CPU. For CPUs which do not provide TDI (SWD-only devices), this pin is not used. J-Link will ignore the signal on this pin when using SWD.		
9	NC	NC	Not connected inside J-Link. Leave open on target hard- ware.		
10	nRESET	I/O	Target CPU reset signal. Typically connected to the RESET pin of the target CPU, which is typically called "nRST", "nRESET" or "RESET".		
11	5V-Supply	Output	This pin can be used to supply power to the target hard- ware. For more information about how to enable/disable the power supply, please refer to <i>Target power supply</i> on page 411.		
12	TRACECLK	Input	Input trace clock. Trace clock = $1/2$ CPU clock.		
13	5V-Supply	Output	This pin can be used to supply power to the target hard- ware. For more information about how to enable/disable the power supply, please refer to <i>Target power supply</i> on page 411.		
14	TRACE- DATA[0] 14 10: 19-pip 17	Input	Input Trace data pin 0.		

Table 14.10: 19-pin JTAG/SWD and Trace pinout

PIN	SIGNAL	TYPE	Description
16	TRACE- DATA[1]	Input	Input Trace data pin 0.
18	TRACE- DATA[2]	Input	Input Trace data pin 0.
20	TRACE- DATA[3]	Input	Input Trace data pin 0.

Table 14.10: 19-pin JTAG/SWD and Trace pinout

Pins 3, 5, 15, 17, 19 are GND pins connected to GND in J-Trace CM3. They should also be connected to GND in the target system.

14.3.1 Target power supply

Pins 11 and 13 of the connector can be used to supply power to the target hardware. Supply voltage is 5V, max. current is 300mA. The output current is monitored and protected against overload and short-circuit.

Power can be controlled via the J-Link commander. The following commands are available to control power:

Explanation
Switch target power on
Switch target power off
Set target power supply default to "on"
Set target power supply default to "off"

Table 14.11: Command List

14.4 9-pin JTAG/SWD connector

Some target boards only provide a 9-pin JTAG/ SWD connector for Cortex-M. For these devices SEGGER provides a 20-pin -> 9-pin Cortex-M adapter.

		7
VTref		SWDIO / TMS
GND 🗌	3 • • 4	SWCLK / TCK
GND	5 • • 6	SWO / TDO
	7 ●8	
NC	9 • • 10	nRESET

The following table lists the output of the 9-pin Cortex-M connector.

PIN	SIGNAL	TYPE	Description
1	VTref	Input	This is the target reference voltage. It is used to check if the target has power, to create the logic-level reference for the input comparators and to control the output logic levels to the target. It is normally fed from Vdd of the target board and must not have a series resistor.
2	SWDIO/ TMS	I/O / output	SWDIO: (Single) bi-directional data pin. JTAG mode set input of target CPU. This pin should be pulled up on the target. Typically connected to TMS of the target CPU.
4	SWCLK/TCK	Output	SWCLK: Clock signal to target CPU. It is recommended that this pin is pulled to a defined state of the target board. Typically connected to TCK of target CPU. JTAG clock signal to target CPU.
6	SWO/TDO	Input	When using SWD, this pin is used as Serial Wire Output trace port (optional, not required for SWD communica- tion). JTAG data output from target CPU. Typically connected to TDO of the target CPU.
			This pin (normally pin 7) is not existent on the 19-pin JTAG/SWD and Trace connector.
8	TDI	Output	JTAG data input of target CPU It is recommended that this pin is pulled to a defined state on the target board. Typically connected to TDI of the target CPU. For CPUs which do not provide TDI (SWD-only devices), this pin is not used. J-Link will ignore the signal on this pin when using SWD.
9	NC (TRST)	NC	By default, TRST is not connected, but the Cortex-M Adapter comes with a solder bridge (NR1) which allows TRST to be connected to pin 9 of the Cortex-M adapter.

Table 14.12: 9-pin JTAG/SWD pinout

Pins 3 and 5 are GND pins connected to GND on the Cortex-M adapter. They should also be connected to GND in the target system.

14.5 Reference voltage (VTref)

VTref is the target reference voltage. It is used by the J-Link to check if the target has power, to create the logic-level reference for the input comparators and to control the output logic levels to the target. It is normally fed from Vdd of the target board and must not have a series resistor.

In cases where the VTref signal should not be wired to save one more pin / place on the target hardware interface connector (e.g. in production environments), SEGGER offers a special adapter called J-Link Supply Adapter which can be used for such purposes. Further information regarding this, can be found on the SEGGER website (https://www.segger.com/jlink-adapters-supply.html)

To gurantee proper debug functionality, please make sure to connect at least on of the GND pins to GND (Pin 4, 6, 8, 10, 12, 14^* , 16^* , 18^* , 20^*).

Note: *On later J-Link products like the J-Link ULTRA+, these pins are reserved for firmware extension purposes. They can be left open or connected to GND in normal debug environment. They are not essential for JTAG/SWD in general.

14.6 Adapters

There are various adapters available for J-Link as for example the JTAG isolator, the J-Link RX adapter or the J-Link Cortex-M adapter.

For more information about the different adapters, please refer to *http://www.segger.com/jlink-adapters.html.*

Chapter 15 Background information

This chapter provides background information about JTAG and ARM. The ARM7 and ARM9 architecture is based on *Reduced Instruction Set Computer* (RISC) principles. The instruction set and the related decode mechanism are greatly simplified compared with microprogrammed *Complex Instruction Set Computer* (CISC).

15.1 JTAG

JTAG is the acronym for Joint Test Action Group. In the scope of this document, "the JTAG standard" means compliance with IEEE Standard 1149.1-2001.

15.1.1 Test access port (TAP)

JTAG defines a TAP (Test access port). The TAP is a general-purpose port that can provide access to many test support functions built into a component. It is composed as a minimum of the three input connections (TDI, TCK, TMS) and one output connection (TDO). An optional fourth input connection (nTRST) provides for asynchronous initialization of the test logic.

PIN	Туре	Explanation
тск	Input	The test clock input (TCK) provides the clock for the test logic.
TDI	Input	Serial test instructions and data are received by the test logic at test data input (TDI).
TMS	Input	The signal received at test mode select (TMS) is decoded by the TAP controller to control test operations.
TDO	Output	Test data output (TDO) is the serial output for test instructions and data from the test logic.
nTRST	Input (optional)	The optional test reset (nTRST) input provides for asyn- chronous initialization of the TAP controller.

Table 15.1: Test access port

15.1.2 Data registers

JTAG requires at least two data registers to be present: the bypass and the boundary-scan register. Other registers are allowed but are not obligatory.

Bypass data register

A single-bit register that passes information from TDI to TDO.

Boundary-scan data register

A test data register which allows the testing of board interconnections, access to input and output of components when testing their system logic and so on.

15.1.3 Instruction register

The instruction register holds the current instruction and its content is used by the TAP controller to decide which test to perform or which data register to access. It consist of at least two shift-register cells.

15.1.4 The TAP controller

The TAP controller is a synchronous finite state machine that responds to changes at the TMS and TCK signals of the TAP and controls the sequence of operations of the circuitry.

TAP controller state diagram

15.1.4.1 State descriptions

Reset

The test logic is disabled so that normal operation of the chip logic can continue unhindered. No matter in which state the TAP controller currently is, it can change into Reset state if TMS is high for at least 5 clock cycles. As long as TMS is high, the TAP controller remains in Reset state.

Idle

Idle is a TAP controller state between scan (DR or IR) operations. Once entered, this state remains active as long as TMS is low.

DR-Scan

Temporary controller state. If TMS remains low, a scan sequence for the selected data registers is initiated.

IR-Scan

Temporary controller state. If TMS remains low, a scan sequence for the instruction register is initiated.

Capture-DR

Data may be loaded in parallel to the selected test data registers.

Shift-DR

The test data register connected between TDI and TDO shifts data one stage towards the serial output with each clock.

Exit1-DR

Temporary controller state.

Pause-DR

The shifting of the test data register between TDI and TDO is temporarily halted.

Exit2-DR

Temporary controller state. Allows to either go back into Shift-DR state or go on to Update-DR.

Update-DR

Data contained in the currently selected data register is loaded into a latched parallel output (for registers that have such a latch). The parallel latch prevents changes at the parallel output of these registers from occurring during the shifting process.

Capture-IR

Instructions may be loaded in parallel into the instruction register.

Shift-IR

The instruction register shifts the values in the instruction register towards TDO with each clock.

Exit1-IR

Temporary controller state.

Pause-IR

Wait state that temporarily halts the instruction shifting.

Exit2-IR

Temporary controller state. Allows to either go back into Shift-IR state or go on to Update-IR.

Update-IR

The values contained in the instruction register are loaded into a latched parallel output from the shift-register path. Once latched, this new instruction becomes the current one. The parallel latch prevents changes at the parallel output of the instruction register from occurring during the shifting process.

15.2 Embedded Trace Macrocell (ETM)

Embedded Trace Macrocell (ETM) provides comprehensive debug and trace facilities for ARM processors. ETM allows to capture information on the processor's state without affecting the processor's performance. The trace information is exported immediately after it has been captured, through a special trace port.

Microcontrollers that include an ETM allow detailed program execution to be recorded and saved in real time. This information can be used to analyze program flow and execution time, perform profiling and locate software bugs that are otherwise very hard to locate. A typical situation in which code trace is extremely valuable, is to find out how and why a "program crash" occurred in case of a runaway program count.

A debugger provides the user interface to J-Trace and the stored trace data. The debugger enables all the ETM facilities and displays the trace information that has been captured. J-Trace is seamlessly integrated into the IAR Embedded Workbench® IDE. The advanced trace debugging features can be used with the IAR C-SPY debugger.

15.2.1 Trigger condition

The ETM can be configured in software to store trace information only after a specific sequence of conditions. When the trigger condition occurs the trace capture stops after a programmable period.

15.2.2 Code tracing and data tracing

Code trace

Code tracing means that the processor outputs trace data which contain information about the instructions that have been executed at last.

Data trace

Data tracing means that the processor outputs trace data about memory accesses (read / write access to which address and which data has been read / stored). In general, J-Trace supports data tracing, but it depends on the debugger if this option is available or not. Note that when using data trace, the amount of trace data to be captured rises enormously.

15.2.3 J-Trace integration example - IAR Embedded Workbench for ARM

In the following a sample integration of J-Trace and the trace functionality on the debugger side is shown. The sample is based on IAR's Embedded Workbench for ARM integration of J-Trace.

15.3 Embedded Trace Buffer (ETB)

The ETB is a small, circular on-chip memory area where trace information is stored during capture. It contains the data which is normally exported immediately after it has been captured from the ETM. The buffer can be read out through the JTAG port of the device once capture has been completed. No additional special trace port is required, so that the ETB can be read via J-Link. The trace functionality via J-Link is limited by the size of the ETB. While capturing runs, the trace information in the buffer will be overwritten every time the buffer size has been reached.

Lib VI.0. 2040X24 Dit AHA
ETB is present.
ID register (ETB[0x00]) : 1B900F0F
RAM depth (ETB[0x01]) : 00000800
RAM width (ETB[0x02]): 00000018
Status (ETB[0x03]): 00000008
RAM data $(ETB[0\times04]) : 00CBB1B7$
RAM read pointer (ETB[0x05]) : 00000000
RAM write pointer $\langle ETBE(0\times061) \rangle = 000000000$
Trigger counter (FIB[0×07]) : 0000000
Control (ETB[0x08]): 00000000 J-Link>

The result of the limited buffer size is that not more data can be traced than the buffer can hold. Because of this limitation, an ETB is not a fully- alternative to the direct access to an ETM via J-Trace.

15.4 Flash programming

J-Link / J-Trace comes with a DLL, which allows - amongst other functionalities - reading and writing RAM, CPU registers, starting and stopping the CPU, and setting breakpoints. The standard DLL does not have API functions for flash programming. However, the functionality offered can be used to program the flash. In that case, a flashloader is required.

15.4.1 How does flash programming via J-Link / J-Trace work?

This requires extra code. This extra code typically downloads a program into the RAM of the target system, which is able to erase and program the flash. This program is called RAM code and "knows" how to program the flash; it contains an implementation of the flash programming algorithm for the particular flash. Different flash chips have different programming algorithms; the programming algorithm also depends on other things such as endianess of the target system and organization of the flash memory (for example 1 * 8 bits, 1 * 16 bits, 2 * 16 bits or 32 bits). The RAM code requires data to be programmed into the flash memory. There are 2 ways of supplying this data: Data download to RAM or data download via DCC.

15.4.2 Data download to RAM

The data (or part of it) is downloaded to another part of the RAM of the target system. The Instruction pointer (R15) of the CPU is then set to the start address of the RAM code, the CPU is started, executing the RAM code. The RAM code, which contains the programming algorithm for the flash chip, copies the data into the flash chip. The CPU is stopped after this. This process may have to be repeated until the entire data is programmed into the flash.

15.4.3 Data download via DCC

In this case, the RAM code is started as described above before downloading any data. The RAM code then communicates with the host computer (via DCC, JTAG and J-Link / J-Trace), transferring data to the target. The RAM code then programs the data into flash and waits for new data from the host. The WriteMemory functions of J-Link / J-Trace are used to transfer the RAM code only, but not to transfer the data. The CPU is started and stopped only once. Using DCC for communication is typically faster than using WriteMemory for RAM download because the overhead is lower.

15.4.4 Available options for flash programming

There are different solutions available to program internal or external flashes connected to ARM cores using J-Link / J-Trace. The different solutions have different fields of application, but of course also some overlap.

15.4.4.1 J-Flash - Complete flash programming solution

J-Flash is a stand-alone Windows application, which can read / write data files and program the flash in almost any ARM system. J-Flash requires an extra license from SEGGER.

15.4.4.2 RDI flash loader: Allows flash download from any RDI-compliant tool chain

RDI (Remote debug interface) is a standard for "debug transfer agents" such as J-Link. It allows using J-Link from any RDI compliant debugger. RDI by itself does not include download to flash. To debug in flash, you need to somehow program your application program (debuggee) into the flash. You can use J-Flash for this purpose, use the flash loader supplied by the debugger company (if they supply a matching flash loader) or use the flash loader integrated in the J-Link RDI software. The RDI software as well as the RDI flash loader require licenses from SEGGER.

15.4.4.3 Flash loader of compiler / debugger vendor such as IAR

A lot of debuggers (some of them integrated into an IDE) come with their own flash loaders. The flash loaders can of course be used if they match your flash configuration, which is something that needs to be checked with the vendor of the debugger.

15.4.4.4 Write your own flash loader

Implement your own flash loader using the functionality of the JLinkARM.dll as described above. This can be a time consuming process and requires in-depth knowl-edge of the flash programming algorithm used as well as of the target system.

15.5 J-Link / J-Trace firmware

The heart of J-Link / J-Trace is a microcontroller. The firmware is the software executed by the microcontroller inside of the J-Link / J-Trace. The J-Link / J-Trace firmware sometimes needs to be updated. This firmware update is performed automatically as necessary by the JLinkARM.dll.

15.5.1 Firmware update

Every time you connect to J-Link / J-Trace, JLinkARM.dll checks if its embedded firmware is newer than the one used the J-Link / J-Trace. The DLL will then update the firmware automatically. This process takes less than 3 seconds and does not require a reboot.

It is recommended that you always use the latest version of JLinkARM.dll.

In the screenshot:

- The red box identifies the new firmware.
- The green box identifies the old firmware which has been replaced.

15.5.2 Invalidating the firmware

Downdating J-Link / J-Trace is not performed automatically through an old JLinkARM.dll. J-Link / J-Trace will continue using its current, newer firmware when using older versions of the JLinkARM.dll.

Note: Downdating J-Link / J-Trace is not recommended, you do it at your own risk!

Note: Note also the firmware embedded in older versions of JLinkARM.dll might not execute properly with newer hardware versions.

To downdate J-Link / J-Trace, you need to invalidate the current J-Link / J-Trace firmware, using the command <code>exec InvalidateFW</code>.

In the screenshot, the red box contains information about the formerly used J-Link / J-Trace firmware version.

Use an application (for example $_{JLink.exe}$) which uses the desired version of JLinkARM.dll. This automatically replaces the invalidated firmware with its embedded firmware.

In the screenshot:

- "Updating firmware" identifies the new firmware. "Replacing firmware" identifies the old firmware which has been replaced.

Chapter 16 Designing the target board for trace

This chapter describes the hardware requirements which have to be met by the target board.

16.1 Overview of high-speed board design

Failure to observe high-speed design rules when designing a target system containing an ARM Embedded Trace Macrocell (ETM) trace port can result in incorrect data being captured by J-Trace.You must give serious consideration to high-speed signals when designing the target system.

The signals coming from an ARM ETM trace port can have very fast rise and fall times, even at relatively low frequencies.

Note: These principles apply to all of the trace port signals (TRACEPKT[0:15], PIPESTAT[0:2], TRACESYNC), but special care must be taken with TRACECLK.

16.1.1 Avoiding stubs

Stubs are short pieces of track that tee off from the main track carrying the signal to, for example, a test point or a connection to an intermediate device. Stubs cause impedance discontinuities that affect signal quality and must be avoided.

Special care must therefore be taken when ETM signals are multiplexed with other pin functions and where the PCB is designed to support both functions with differing tracking requirements.

16.1.2 Minimizing Signal Skew (Balancing PCB Track Lengths)

You must attempt to match the lengths of the PCB tracks carrying all of TRACECLK, PIPESTAT, TRACESYNC, and TRACEPKT from the ASIC to the mictor connector to be within approximately 0.5 inches (12.5mm) of each other. Any greater differences directly impact the setup and hold time requirements.

16.1.3 Minimizing Crosstalk

Normal high-speed design rules must be observed. For example, do not run dynamic signals parallel to each other for any significant distance, keep them spaced well apart, and use a ground plane and so forth. Particular attention must be paid to the TRACECLK signal. If in any doubt, place grounds or static signals between the TRACECLK and any other dynamic signals.

16.1.4 Using impedance matching and termination

Termination is almost certainly necessary, but there are some circumstances where it is not required. The decision is related to track length between the ASIC and the JTAG+Trace connector, see *Terminating the trace signal* on page 431 for further reference.

16.2 Terminating the trace signal

To terminate the trace signal, you can choose between three termination options:

- Matched impedance.
- Series (source) termination.
- DC parallel termination.

Matched impedance

Where available, the best termination scheme is to have the ASIC manufacturer match the output impedance of the driver to the impedance of the PCB track on your board. This produces the best possible signal.

Series (source) termination

This method requires a resistor fitted in series with signal. The resistor value plus the output impedance of the driver must be equal to the PCB track impedance.

DC parallel termination

This requires either a single resistor to ground, or a pull-up/pull-down combination of resistors (Thevenin termination), fitted at the end of each signal and as close as possible to the JTAG+Trace connector. If a single resistor is used, its value must be set equal to the PCB track impedance. If the pull-up/pull-down combination is used, their resistance values must be selected so that their parallel combination equals the PCB track impedance.

Caution:

At lower frequencies, parallel termination requires considerably more drive capability from the ASIC than series termination and so, in practice, DC parallel termination is rarely used.

16.2.1 Rules for series terminators

Series (source) termination is the most commonly used method. The basic rules are:

- 1. The series resistor must be placed as close as possible to the ASIC pin (less than 0.5 inches).
- 2. The value of the resistor must equal the impedance of the track minus the output impedance of the output driver. So for example, a 50 PCB track driven by an output with a 17 impedance, requires a resistor value of 33.
- 3. A source terminated signal is only valid at the end of the signal path. At any point between the source and the end of the track, the signal appears distorted because of reflections. Any device connected between the source and the end of the signal path therefore sees the distorted signal and might not operate correctly. Care must be taken not to connect devices in this way, unless the distortion does not affect device operation.

16.3 Signal requirements

The table below lists the specifications that apply to the signals as seen at the JTAG+Trace connector.

Signal	Value
Fmax	200MHz
Ts setup time (min.)	2.0ns
Th hold time (min.)	1.0ns
TRACECLK high pulse width (min.)	1.5ns
TRACECLK high pulse width (min.)	1.5ns

Table 16.1: Signal requirements

Chapter 17 Semihosting

J-Link supports semihosting for ARM targets. This chapter explains what semihosting is, what it can be used for and how to enable semihosting in different environments.

17.1 Introduction

Semihosting is a mechanism for ARM based target devices to provide a way to communicate/interact with a host system (the PC where the debugger is running on) to allow different operations to be performed /automatized. Typical use-cases for semihosting are:

- Calls to printf() in the target to be forwarded to the host system and then output in a console/terminal on the host
- Calls to scanf() to retrieve user input entered in a console/terminal on the host and then being received and evaluated by the target
- Performing file I/O operations on the host system (reading / writing files)
- Writing a flashloader that reads the bin file to be flashed from the host system and performs the flashing operation chunk-wise

Most standard I/O libraries for embedded applications come with semihosting implementations for printf() and scanf().

17.1.1 Advantages

- Provides standardized commands for file I/O operations on the host, allowing relatively complex operations with minimal logic in the target application
- Does not need chip-specific hardware capabilities
- Semihosting handling is natively supported by many debuggers/IDEs, for example GDB.

17.1.2 Disadvantages

 Target CPU is halted on each semihosting command, debugger evaluates the semihosting command and restarts the CPU. This affects real-time behavior of the system.

17.2 Debugger support

If semihosting is supported or not depends on the actual debugger being used. Most modern IDEs / Debuggers support semihosting. The following debuggers / IDEs are known to support semihosting:

- J-Link Debugger
- J-Link GDBServer + GDB
- SEGGER Embedded Studio
- J-Link RDI (and therefor most RDI compliant debuggers)
- IAR Embedded Workbench for ARM
- Keil MDK-ARM
- ARM AXD

17.3 Implementation

In general, there are two ways of implement semihosting which are explained in the following:

- SVC instruction (called SWI on legacy CPUs)
- Breakpoint instruction
- J-Link GDBServer optimized version

17.3.1 SVC instruction

Inside printf() calls etc. that shall perform semihosting, an SVC instruction is present which causes the CPU to issue a software interrupt and jump to the SVC exception handler. The debugger usually sets a breakpoint on the first instruction of the SVC exception handler or sets a vector catch that has the same effect but does not waste one hardware breakpoint. If vector catch is available depends on the CPU. Once the CPU has been halted, the debugger can identify the cause of the SVC exception by analyzing the SVC instruction that caused the exception. In the instruction there is a SVC reason/number encoded. The number may differ if the CPU was in ARM or Thumb mode when the SVC instruction was executed. The following SVC reasons are revsered for semihosting:

- ARM mode: 0x123456
- Thumb mode: 0xAB

Once the debugger has performed the semihosting operation and evaluated the command, it will restart the target CPU right behind the SVC instruction that caused the semihosting call. So it is debuggers responsibility to perform the exception return.

Disadvantages

If the SVC instruction is also used by the user application or a operating system on the target, the CPU will be halted on every semihosting exception and be restarted by the debugger. This affects real-time behavior of the target application.

17.3.2 Breakpoint instruction

A breakpoint instruction is compiled into the code that makes use of semihosting (usually somewhere inside the printf() function in a library). The CPU halts as soon as the breakpoint instruction is hit and allows the debugger to perform semihosting operations. Once the CPU has been halted, the debugger is able to determine the halt reason by analyzing the breakpoint instruction that caused the halt. In the breakpoint instruction, a "halt reason" can be encoded. The halt reason may differ if the breakpoint instruction is an ARM instruction or Thumb instruction. The following halt reasons are reserved for semihosting:

- ARM mode: 0x123456
- Thumb mode: 0xAB

Disadvantages

Having a breakpoint instruction compiled in a library call will make it necessary to have different compile options for debug and release configurations as the target application will not run stand-alone, without debugger intervention.

17.3.3 J-Link GDBServer optimized version

When using J-Link GDBServer with a GDB-based environment, there is a third implementation for semihosting available which is a hybrid of the other implementations, combining the advantages of both. With this implementation, an SVC instruction with the usual SVC reason is used to issue a semihosting call but the debugger does not set a breakpoint or vector catch on the start of the SVC exception handler. Instead, the SVC exception handler provides some code that detects if the reason was a semihosting call, if yes it immediately performs a return from exception on which the debugger has set a hardware breakpoint. This allows the application to continue normally in case no debugger is connected and handling the semihosting call. It also inhibits the CPU from being halted on each non-semihosting call, preserving the realtime behavior of the target application.

Advantages

Application also runs stand-alone (no debugger connected).

Real-time behavior of the application is preserved.

Disadvantages

One hardware breakpoint is not available for debugging / stepping as it is permanently used while semihosting is enabled.

Only works with J-Link GDBServer as other debuggers do not support this specialized version.

17.3.3.1 SVC exception handler sample code

In the following, some sample code for the SVC handler, prepared to be used with J-Link GDBServer optimized semihosting, is given:

SVC_Handler:

```
For semihosting R0 and R1 contain the semihosting information and may not
   be changed before semihosting is handled.
  ; If R2 and R3 contain values for the SVC handler or need to be restored for
  ; the calling function, save them on the stack.
#if SAVE_REGS_IN_SVC

17.4 Communication protocol

Semihosting defines a standardized set of semihosting commands that need to be supported by a debugger, claiming that it supports semihosting. In the following, the communication protocol for semihosting as well as the specified commands are explained.

17.4.1 Register R0

Right before the operation that halts the CPU for semihosting, is performed, the target application needs to prepare CPU register R0 and (depending on the command) also some other CPU registers.

On halt, R0 will hold the semihosting command, so the debugger can determine further parameters and operation to be performed, from it.

17.4.2 Command SYS_OPEN (0x01)

Opens a file on the host system.

Register R1 holds a pointer to an address on the target, that specifies a 3-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Pointer to a null-terminated string that specifies the file to open.

Special: The string ":tt" specifies the console input/output (usually stdin / stdout). Which one is selected depends on if the stream is opened for reading or writing.

Word 1

A number that specifies how the file is to be opened (reading/writing/appending etc.). In the following, the corresponding ISO C fopen() modes for the numbers are listed.

Word1	ISO C fopen() mode
0	r
1	rb
2	r+
3	r+b
4	W
5	wb
6	w+
7	w+b
8	a
9	ab
10	a+
11	a+b

Table 17.1: ISO C fopen() modes

Word 2

Integer that specifies the length of the string (excluding the terminating null character) pointed to by word 0.

Return value

Operation result is written to register R0 by the debugger.

!= 0 O.K., handle of the file (needed for SYS_CLOSE etc.)

== -1 Error

17.4.3 Command SYS_CLOSE (0x02)

Closes a file on the host system.

Register R1 holds a pointer to an address on the target, that specifies a 1-word (32bit each) buffer where additional information for the command can be found.

Word 0

Handle of the file retrieved on SYS_OPEN

Return value

Operation result is written to register R0 by the debugger.

== 0 O.K. == -1 Error

17.4.4 Command SYS_WRITEC (0x03)

Writes a single character to the debug channel on the host system (stdout in most cases).

Register R1 holds a pointer to an address on the target, that specifies a 1-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Pointer to the character to the written.

Return value

None

17.4.5 Command SYS_WRITE0 (0x04)

Writes a null-terminated string (excluding the null character) to the debug channel on the host system.

Register R1 holds a pointer to the string that shall be written.

Return value

None

17.4.6 Command SYS_WRITE (0x05)

Writes a given number of bytes to a file that has been previously opened via SYS_OPEN. Exceptions: Handle 0-2 which specify stdin, stdout, stderr (in this order) do not require to be opened with SYS_OPEN before used. This command behaves compatible to the ANSI C function fwrite() meaning that writing is started at the last position of the write pointer on the host.

Register R1 holds a pointer to an address on the target, that specifies a 3-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Handle of the file to be written.

Word 1

Pointer to the data on the target, to be written.

Word 2

Number of bytes to write

Return value

Operation result is written to register R0 by the debugger.

- == 0 O.K.
- != 0 Number of bytes to write left (in case not all bytes could be written)

17.4.7 Command SYS_READ (0x06)

Reads a given number of bytes from a file that has been previously opened via SYS_OPEN. Exceptions: Handle 0-2 which specify stdin, stdout, stderr (in this order) do not require to be opened with SYS_OPEN before used. This command behaves compatible to the ANSI C function fread() meaning that reading is started at the last position of the read pointer on the host.

Register R1 holds a pointer to an address on the target, that specifies a 3-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Handle of the file to be read.

Word 1

Pointer to a buffer on the target where data from file is written to.

Word 2

Number of bytes to read

Return value

Operation result is written to register R0 by the debugger.

== 0 O.K.

Number of bytes to read left (in case not all bytes could be read). If identi-

!= 0 cal to the number of bytes to be read, read pointer was pointing to end-offile and no bytes have been read.

17.4.8 Command SYS_READC (0x07)

Reads a single character from the debug channel on the host (usually stdin).

Register R1 is set to 0.

Return value

Character that has been read is written to register R0.

17.4.9 Command SYS_ISTTY (0x09)

Checks if a given handle is an "interactive device" (stdin, stdout, ...).

Register R1 holds a pointer to an address on the target, that specifies a 1-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Handle of the file to be checked.

Return value

Operation result is written to register R0 by the debugger.

- == 1 O.K., given handle is an interactive device.
- == 0 O.K., given handle is not an interactive device.

Else Error

17.4.10 Command SYS_SEEK (0x0A)

Moves the filepointer of a file previously opened via SYS_OPEN to a specific position in the file. Behaves compliant to the ANSI C function fseek().

Register R1 holds a pointer to an address on the target, that specifies a 2-word (32bit each) buffer where additional information for the command can be found.

Word 0

Handle of the file.

Word 1

Position of the filepointer inside the file, to set to.

Return value

Operation result is written to register R0 by the debugger.

== 0 O.K. != 0 Error.

17.4.11 Command SYS_FLEN (0x0C)

Retrieves the size of a file, previously opened by SYS_OPEN, in bytes.

Register R1 holds a pointer to an address on the target, that specifies a 1-word (32bit each) buffer where additional information for the command can be found.

Word 0

Handle of the file.

Return value

Operation result is written to register R0 by the debugger.

>= 0 File size in bytes

```
== -1 Error.
```

17.4.12 Command SYS_REMOVE (0x0E)

Deletes a file on the host system.

Register R1 holds a pointer to an address on the target, that specifies a 2-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Pointer to a null-terminated string that specifies the path + file to be deleted.

Word 1

Length of the string pointed to by word 0.

Return value

Operation result is written to register R0 by the debugger.

== 0 O.K. != 0 Error.

17.4.13 Command SYS_RENAME (0x0F)

Renames a file on the host system.

Register R1 holds a pointer to an address on the target, that specifies a 4-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Pointer to a null-terminated string that specifies the old name of the file.

Word 1

Length of the string (without terminating null-character) pointed to by word 0.

Word 2

Pointer to a null-terminated string that specifies the new name of the file.

Word 3

Length of the string (without terminating null-character) pointed to by word 2.

Return value

Operation result is written to register R0 by the debugger.

```
== 0 O.K.
!= 0 Error.
```

17.4.14 Command SYS_GET_CMDLINE (0x15)

Gets the command line (argc, argv) from the process on the host system as a single string. argv elements will be separated by spaces.

Register R1 holds a pointer to an address on the target, that specifies a 2-word (32-bit each) buffer where additional information for the command can be found.

Word 0

Pointer to a buffer on the target system to store the command line to.

Word 1

Size of the buffer in bytes.

Return value

After the operation, word 1 will hold the length of the command line string.

Operation result is written to register R0 by the debugger.

== 0 O.K. != 0 Error.

17.4.15 Command SYS_EXIT (0x18)

Used to tell the debugger if an application exited/completed with success or error. Usually, this also ends the debug session automatically.

Register R1 is one of the following values:

Meaning
Application exited normally.
Application exited with error.

Table 17.2: SYS_EXIT exit codes

Return value

None.

17.5 Enabling semihosting in J-Link GDBServer

By default, semihosting is disabled in J-Link GDBServer. Depending on the mechanism to be used, different setups are necessary

17.5.1 SVC variant

The following commands need to be added to the gdbinit file that is executed at the start of a debug session:

monitor semihosting enable
monitor semihosting breakOnError
monitor semihosting IOclient 3
monitor semihosting setargs "<argv>" (in case SYS_GET_CMDLINE command is used)

For more detailed information about the monitor commands supported by J-Link GDBServer, please refer to *Supported remote (monitor) commands* on page 110.

17.5.2 Breakpoint variant

The following commands need to be added to the gdbinit file that is executed at the start of a debug session:

monitor semihosting enable

17.5.3 J-Link GDBServer optimized variant

The following commands need to be added to the gdbinit file that is executed at the start of a debug session:

monitor semihosting enable <AddrSemiBreak>

Please also make sure that an appropriate SVC exception handler is linked in the application. For sample code, please refer to *SVC exception handler sample code* on page 437.

17.6 Enabling Semihosting in J-Link RDI + AXD

This semihosting mechanism can be disabled or changed by the following debugger internal variables:

\$semihosting_enabled

Set this variable to 0 to disable semihosting. If you are debugging an application running from ROM, this allows you to use an additional watchpoint unit. Set this variable to 1 to enable semihosting. This is the default. Set this variable to 2 to enable Debug Communications Channel (DCC) semihosting. The S bit in \$vector_catch has no effect unless semihosting is disabled.

\$semihosting_vector

This variable controls the location of the breakpoint set by J-Link RDI to detect a semihosted SWI. It is set to the SWI entry in the exception vector table () by default.

17.6.0.1 Using SWIs in your application

If your application requires semihosting as well as having its own SWI handler, set \$semihosting_vector to an address in your SWI handler. This address must point to an instruction that is only executed if your SWI handler has identified a call to a semihosting SWI. All registers must already have been restored to whatever values they had on entry to your SWI handler.

Chapter 18 Support and FAQs

This chapter contains troubleshooting tips as well as solutions for common problems which might occur when using J-Link / J-Trace. There are several steps you can take before contacting support. Performing these steps can solve many problems and often eliminates the need for assistance. This chapter also contains a collection of frequently asked questions (FAQs) with answers.

18.1 Measuring download speed

18.1.1 Test environment

JLink.exe has been used for measurement performance. The hardware consisted of:

- PC with 2.6 GHz Pentium 4, running Win2K
- USB 2.0 port
- USB 2.0 hub
- J-Link
- Target with ARM7 running at 50MHz

Below is a screenshot of JLink.exe after the measurement has been performed.

18.2 Troubleshooting

18.2.1 General procedure

If you experience problems with J-Link / J-Trace, you should follow the steps below to solve these problems:

- 1. Close all running applications on your host system.
- 2. Disconnect the J-Link / J-Trace device from USB.
- 3. Disable power supply on the target.
- 4. Re-connect J-Link / J-Trace with the host system (attach USB cable).
- 5. Enable power supply on the target.
- 6. Try your target application again. If the problem remains continue the following procedure.
- 7. Close all running applications on your host system again.
- 8. Disconnect the J-Link / J-Trace device from USB.
- 9. Disable power supply on the target.
- 10. Re-connect J-Link / J-Trace with the host system (attach the USB cable).
- 11. Enable power supply on the target.
- 12. Start JLink.exe.
- 13. If JLink.exe displays the J-Link / J-Trace serial number and the target processor's core ID, the J-Link / J-Trace is working properly and cannot be the cause of your problem.
- 14. If the problem persists and you own an original product (not an OEM version), see section *Contacting support* on page 449.

18.2.2 Typical problem scenarios

J-Link / J-Trace LED is off

Meaning:

The USB connection does not work.

Remedy:

Check the USB connection. Try to re-initialize J-Link / J-Trace by disconnecting and reconnecting it. Make sure that the connectors are firmly attached. Check the cable connections on your J-Link / J-Trace and the host computer. If this does not solve the problem, check if your cable is defective. If the USB cable is ok, try a different host computer.

J-Link / J-Trace LED is flashing at a high frequency

Meaning:

J-Link / J-Trace could not be enumerated by the USB controller.

Most likely reasons:

- a.) Another program is already using J-Link / J-Trace.
- b.) The J-Link USB driver does not work correctly.

Remedy:

a.) Close all running applications and try to reinitialize J-Link / J-Trace by disconnecting and reconnecting it.

b.) If the LED blinks permanently, check the correct installation of the J-Link USB driver. Deinstall and reinstall the driver as shown in chapter *Setup* on page 157.

J-Link/J-Trace does not get any connection to the target

Most likely reasons:

a.) The JTAG cable is defective.

b.) The target hardware is defective.

Remedy:

Follow the steps described in *General procedure* on page 447.

Before contacting support, make sure you tried to solve your problem by following the steps outlined in section *General procedure* on page 447. You may also try your J-Link / J-Trace with another PC and if possible with another target system to see if it works there. If the device functions correctly, the USB setup on the original machine or your target hardware is the source of the problem, not J-Link / J-Trace.

If you need to contact support, send the following information to support@segger.com:

- A detailed description of the problem.
- J-Link/J-Trace serial number.
- Output of JLink.exe if available.
- Your findings of the signal analysis.
- Information about your target hardware (processor, board, etc.).

J-Link / J-Trace is sold directly by SEGGER or as OEM-product by other vendors. We can support only official SEGGER products.

18.4 Frequently Asked Questions

Supported CPUs

- Q: Which CPUs are supported?
- A: J-Link / J-Trace should work with any ARM7/9 and Cortex-M3 core. For a list of supported cores, see section *Supported CPU cores* on page 60.

Converting data files

- Q: I want to download my application into flash memory using J-Link Commander but my application is a *.hex data file and J-Link Commander supports *.bin files only. How do I download it?
- A: Please use the J-Flash (which is part of the J-Link software and documentation package) software to convert your *.hex/*.mot/... file to a *.bin file. For data file conversion, no J-Flash license is necessary.

Using J-Link in my application

- Q: I want to write my own application and use J-Link / J-Trace. Is this possible?
- A: Yes. We offer a dedicated Software Developer Kit (SDK). See section *J-Link Software Developer Kit (SDK)* on page 156 for further information.

Using DCC with J-Link

- Q: Can I use J-Link / J-Trace to communicate with a running target via DCC?
- A: Yes. The DLL includes functions to communicate via DCC on cores which support DCC, such as ARM7/9/11, Cortex A/R series.

Read status of JTAG pins

- Q: Can J-Link / J-Trace read back the status of the JTAG pins?
- A: Yes, the status of all pins can be read. This includes the outputs of J-Link / J-Trace as well as the supply voltage, which can be useful to detect hardware problems on the target system.

J-Link support of ETM

- Q: Does J-Link support the Embedded Trace Macrocell (ETM)?
- A: No. ETM requires another connection to the ARM chip and a CPU with built-in ETM. Most current ARM7 / ARM9 chips do not have ETM built-in.

J-Link support of ETB

- Q: Does J-Link support the Embedded Trace Buffer (ETB)?
- A: Yes. J-Link supports ETB. Most current ARM7 / ARM9 chips do not have ETB builtin.

Registers on ARM 7 / ARM 9 targets

- Q: I'm running J-Link.exe in parallel to my debugger, on an ARM 7 target. I can read memory okay, but the processor registers are different. Is this normal?
- A: If memory on an ARM 7/9 target is read or written the processor registers are modified. When memory read or write operations are performed, J-Link preserves the register values before they are modified. The register values shown in the debugger's register window are the preserved ones. If a second instance, in this case J-Link.exe, reads the processor registers, it reads the values from the hardware, which are the modified ones. This is why it shows different register values.

Chapter 19 Glossary

This chapter describes important terms used throughout this manual.

Adaptive clocking

A technique in which a clock signal is sent out by J-Link / J-Trace. J-Link / J-Trace waits for the returned clock before generating the next clock pulse. The technique allows the J-Link / J-Trace interface unit to adapt to differing signal drive capabilities and differing cable lengths.

Application Program Interface

A specification of a set of procedures, functions, data structures, and constants that are used to interface two or more software components together.

Big-endian

Memory organization where the least significant byte of a word is at a higher address than the most significant byte. See Little-endian.

Cache cleaning

The process of writing dirty data in a cache to main memory.

Coprocessor

An additional processor that is used for certain operations, for example, for floatingpoint math calculations, signal processing, or memory management.

Dirty data

When referring to a processor data cache, data that has been written to the cache but has not been written to main memory is referred to as dirty data. Only write-back caches can have dirty data because a write-through cache writes data to the cache and to main memory simultaneously. See also cache cleaning.

Dynamic Linked Library (DLL)

A collection of programs, any of which can be called when needed by an executing program. A small program that helps a larger program communicate with a device such as a printer or keyboard is often packaged as a DLL.

Embedded Trace Macrocell (ETM)

ETM is additional hardware provided by debuggable ARM processors to aid debugging with trace functionality.

Embedded Trace Buffer (ETB)

ETB is a small, circular on-chip memory area where trace information is stored during capture.

EmbeddedICE

The additional hardware provided by debuggable ARM processors to aid debugging.

Halfword

A 16-bit unit of information. Contents are taken as being an unsigned integer unless otherwise stated.

Host

A computer which provides data and other services to another computer. Especially, a computer providing debugging services to a target being debugged.

ICache

Instruction cache.

ICE Extension Unit

A hardware extension to the EmbeddedICE logic that provides more breakpoint units.

ID

Identifier.

IEEE 1149.1

The IEEE Standard which defines TAP. Commonly (but incorrectly) referred to as JTAG.

Image

An executable file that has been loaded onto a processor for execution.

In-Circuit Emulator (ICE)

A device enabling access to and modification of the signals of a circuit while that circuit is operating.

Instruction Register

When referring to a TAP controller, a register that controls the operation of the TAP.

IR

See Instruction Register.

Joint Test Action Group (JTAG)

The name of the standards group which created the IEEE 1149.1 specification.

Little-endian

Memory organization where the least significant byte of a word is at a lower address than the most significant byte. See also Big-endian.

Memory coherency

A memory is coherent if the value read by a data read or instruction fetch is the value that was most recently written to that location. Obtaining memory coherency is difficult when there are multiple possible physical locations that are involved, such as a system that has main memory, a write buffer, and a cache.

Memory management unit (MMU)

Hardware that controls caches and access permissions to blocks of memory, and translates virtual to physical addresses.

Memory Protection Unit (MPU)

Hardware that controls access permissions to blocks of memory. Unlike an MMU, an MPU does not translate virtual addresses to physical addresses.

Multi-ICE

Multi-processor EmbeddedICE interface. ARM registered trademark.

RESET

Abbreviation of System Reset. The electronic signal which causes the target system other than the TAP controller to be reset. This signal is also known as "nSRST" "nSYSRST", "nRST", or "nRESET" in some other manuals. See also nTRST.

nTRST

Abbreviation of TAP Reset. The electronic signal that causes the target system TAP controller to be reset. This signal is known as nICERST in some other manuals. See also nSRST.

Open collector

A signal that may be actively driven LOW by one or more drivers, and is otherwise passively pulled HIGH. Also known as a "wired AND" signal.

Processor Core

The part of a microprocessor that reads instructions from memory and executes them, including the instruction fetch unit, arithmetic and logic unit, and the register bank. It excludes optional coprocessors, caches, and the memory management unit.

Program Status Register (PSR)

Contains some information about the current program and some information about the current processor state. Therefore often referred to as Processor Status Register.

Also referred to as Current PSR (CPSR), to emphasize the distinction to the Saved PSR (SPSR). The SPSR holds the value the PSR had when the current function was called, and which will be restored when control is returned.

Remapping

Changing the address of physical memory or devices after the application has started executing. This is typically done to make RAM replace ROM once the initialization has been done.

Remote Debug Interface (RDI)

RDI is an open ARM standard procedural interface between a debugger and the debug agent. The widest possible adoption of this standard is encouraged.

RTCK

Returned TCK. The signal which enables Adaptive Clocking.

RTOS

Real Time Operating System.

Scan Chain

A group of one or more registers from one or more TAP controllers connected between TDI and TDO, through which test data is shifted.

Semihosting

A mechanism whereby the target communicates I/O requests made in the application code to the host system, rather than attempting to support the I/O itself.

SWI

Software Interrupt. An instruction that causes the processor to call a programer-specified subroutine. Used by ARM to handle semihosting.

TAP Controller

Logic on a device which allows access to some or all of that device for test purposes. The circuit functionality is defined in IEEE1149.1.

Target

The actual processor (real silicon or simulated) on which the application program is running.

ТСК

The electronic clock signal which times data on the TAP data lines TMS, TDI, and TDO.

TDI

The electronic signal input to a TAP controller from the data source (upstream). Usually, this is seen when connecting the J-Link / J-Trace Interface Unit to the first TAP controller.

TDO

The electronic signal output from a TAP controller to the data sink (downstream). Usually, this is seen connecting the last TAP controller to the J-Link / J-Trace Interface Unit.

Test Access Port (TAP)

The port used to access a device's TAP Controller. Comprises TCK, TMS, TDI, TDO, and nTRST (optional).

Transistor-Transistor logic (TTL)

A type of logic design in which two bipolar transistors drive the logic output to one or zero. LSI and VLSI logic often used TTL with HIGH logic level approaching +5V and LOW approaching 0V.

Watchpoint

A location within the image that will be monitored and that will cause execution to stop when it changes.

Word

A 32-bit unit of information. Contents are taken as being an unsigned integer unless otherwise stated.

Chapter 20

Literature and references

This chapter lists documents, which we think may be useful to gain deeper understanding of technical details.
